I. PRODUCT INFORMATION

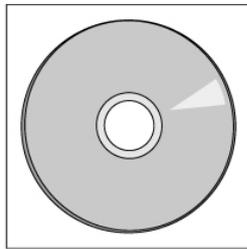

Thank you for purchasing an Edimax BR-6478AC AC1200 wireless concurrent dual-band gigabit router.

I-1. Package Contents

Before you start using this product, please check if there is anything missing in the package, and contact your dealer to claim the missing item(s):

BR-6478AC

CD-ROM

Ethernet

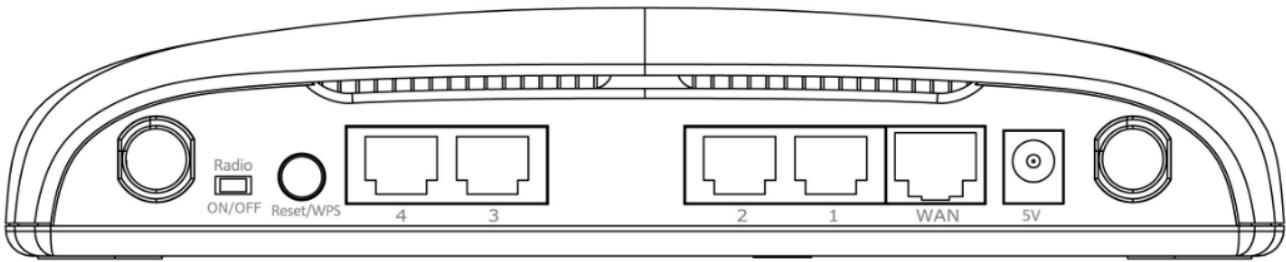

Quick Installation Guide

Power Adapter

I-2. Hardware

Item Name	Description
Antenna	Connects the supplied 3dBi antennas.
Radio ON/OFF Switch	Switch the wireless signal on/off accordingly.
Reset / WPS Button	Resets the router to factory default settings (clears all settings) or starts the WPS function. Reset: Press and hold for 12 seconds to restore all settings to factory defaults. WPS: Press this button for 2–5 seconds to activate the WPS function.
Gigabit LAN Ports	Connects via Ethernet cable to a computer or other network devices.
Gigabit WAN Port	Connects to cable/xDSL modems.
5V Power Port	Connects to the supplied power adapter.

I-3. LED Status

LED	LED Status	Description
Power 	On	Router is on.
	Off	Router is off.
Internet	On	Internet connection is active.
	Flashing	Router is connecting to internet.
	Off	No internet connection.
2.4 GHz 	On	2.4GHz wireless is active.
	Flashing	2.4GHz LAN activity (transferring/receiving data).
	Off	2.4GHz wireless is not active.
5 GHz 	On	5GHz wireless is active.
	Flashing	5GHz LAN activity (transferring/receiving data).
	Off	5GHz wireless is not active.
WAN	On	WAN port connected.
	Flashing	WAN activity (transferring/receiving data)
	Off	WAN port not connected.
LAN 1–4	On	LAN port connected.
	Flashing	LAN activity (transferring or receiving data).
	Off	LAN port not connected.

I-4. Safety Information

In order to ensure the safe operation of the device and its users, please read and act in accordance with the following safety instructions.

1. The router is designed for indoor use only; do not place the router outdoors.
2. Do not place the router in or near hot/humid places, such as a kitchen or bathroom.
3. Do not pull any connected cable with force; carefully disconnect it from the router.
4. The device contains small parts which are a danger to small children under 3 years old. Please keep the router out of reach of children.
5. Do not place the router on paper, cloth, or other flammable materials. The router will become hot during use.
6. There are no user-serviceable parts inside the router. If you experience problems with the router, please contact your dealer of purchase and ask for help.
7. The router is an electrical device and as such, if it becomes wet for any reason, do not attempt to touch it without switching the power supply off. Contact an experienced electrical technician for further help.
8. If you smell burning or see smoke coming from the router then unplug the router immediately, as far as it is safely possible to do so. Call your dealer of purchase for help.

I-5. Features

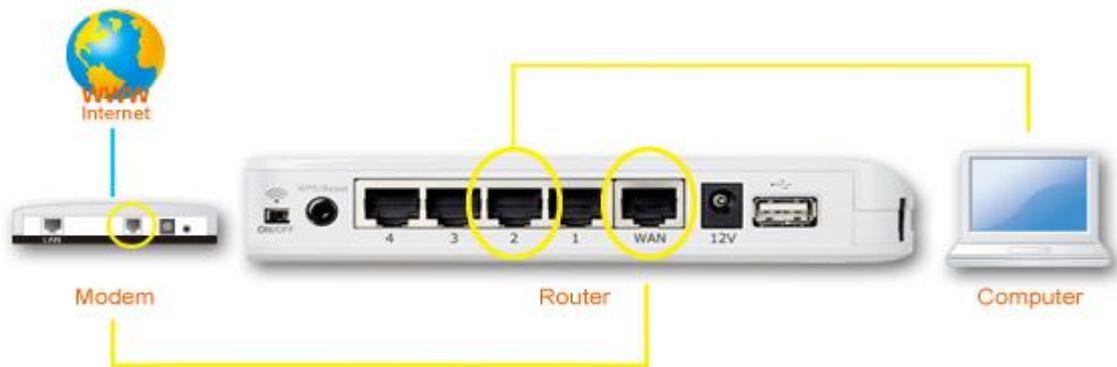

- Supports IEEE 802.11ac & IEEE 802.11a/b/g/n concurrent dual-band connections on 2.4GHz and 5GHz bands.
- Wireless data transmission rate up to 1167Mbps (2.4GHz 300Mbps + 5GHz 867Mbps).
- 4 gigabit LAN ports (data transmission rates up to 1000Mbps).
- Comply with IEEE 802.3/ 802.3u/ 802.3ab standards.
- Smart and automated iQ Setup.
- iQoS for quick and easy bandwidth management.
- Build-in hardware button to enable/disable the wireless signal.
- Wireless signal on/off scheduling function.
- Supports DHCP, Static IP, PPPoE, PPTP, L2TP and WISP connection modes.

- Supports WMM, WEP, WPA, WPA2, DDNS, QoS, IP/MAC filter, DMZ and virtual server.

II. HARDWARE INSTALLATION & NETWORK SETTINGS

II-1. Hardware Installation

Please setup your router, computer, modem and other network devices as shown below.

Before using the BR-6478AC, please make sure your computer is set to use a **dynamic IP address**. This means your computer can obtain an IP address automatically from a DHCP server. Please refer to instructions appropriate for your operating system.

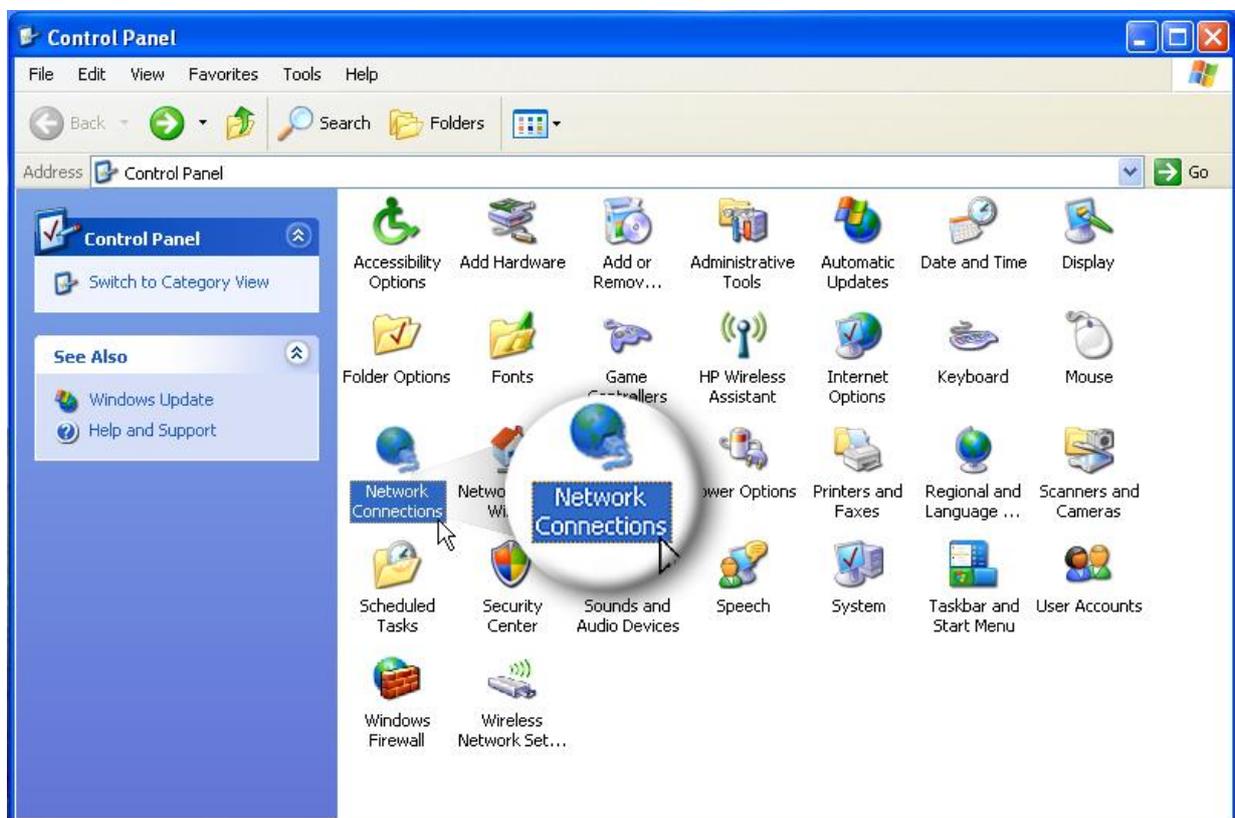

II-2. Network Settings

II-2-1. Windows XP

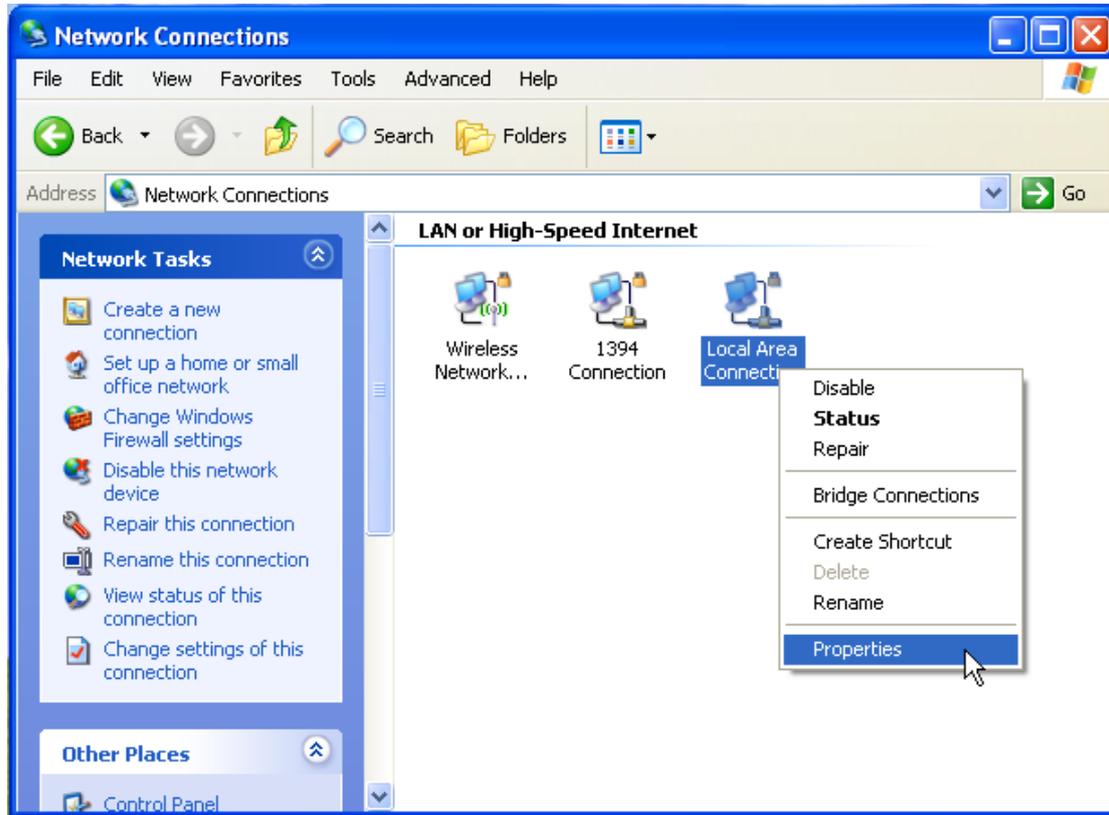

1. Click the “Start” button, then click “Control Panel”.

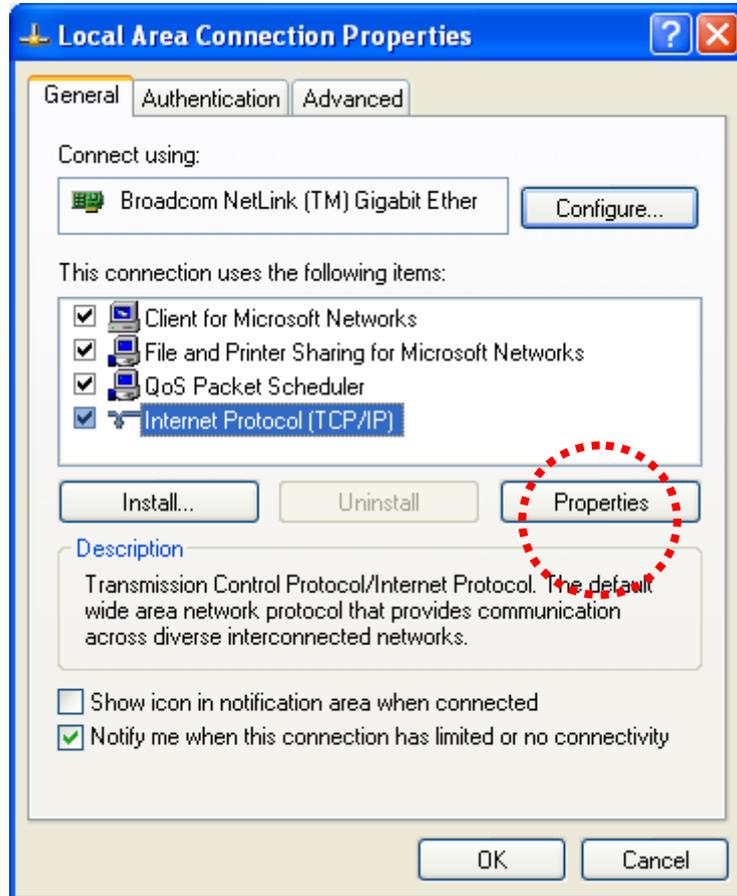

2. Double click the “Network Connections” icon and the “Network Connections” window will appear.

3. Right click “Local Area Connection” on the mouse. When the “Local Area Connection Properties” window appears, click “Properties”.

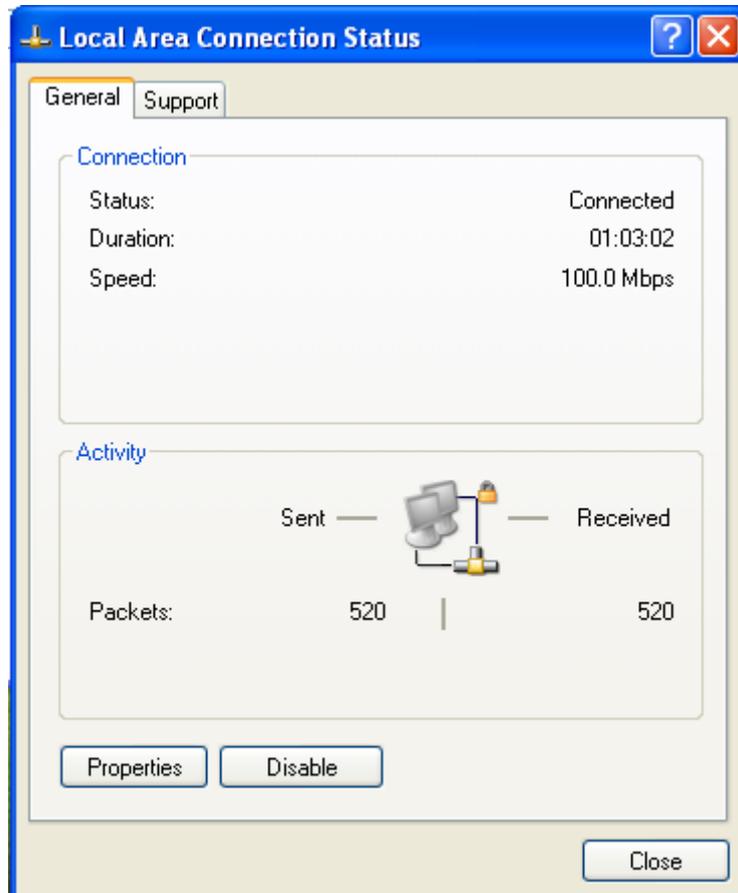

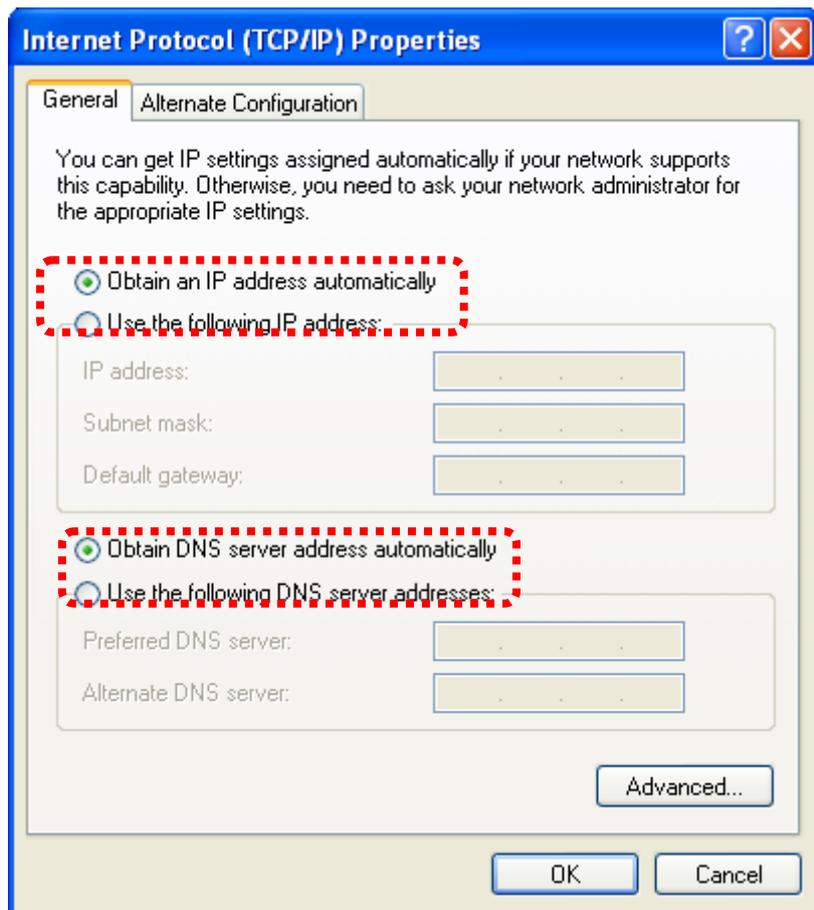

4. Select “TCP/IP” and click “Properties”.

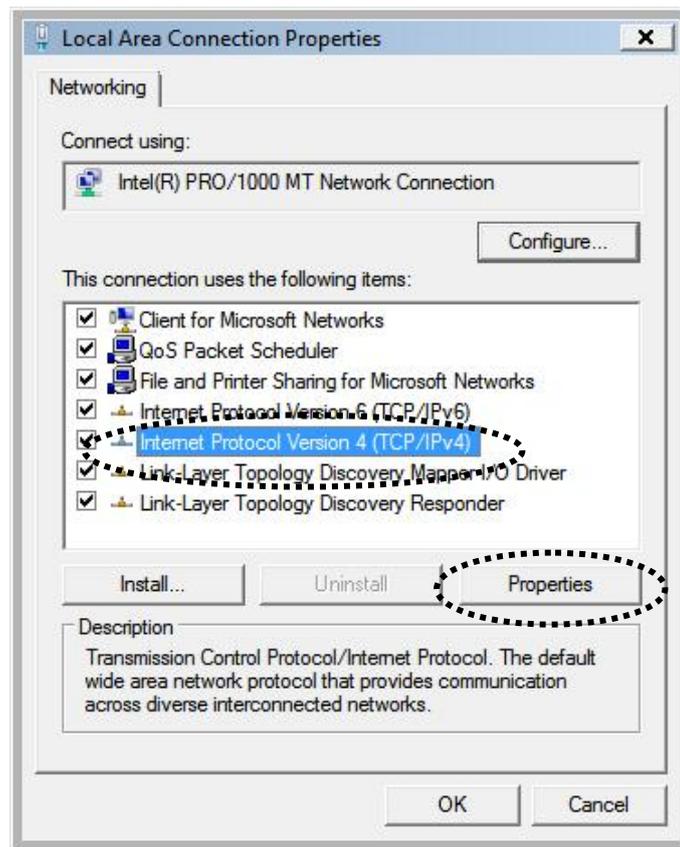

5. Select “Obtain an IP address automatically” and “Obtain DNS server

address automatically”, then click “OK”.

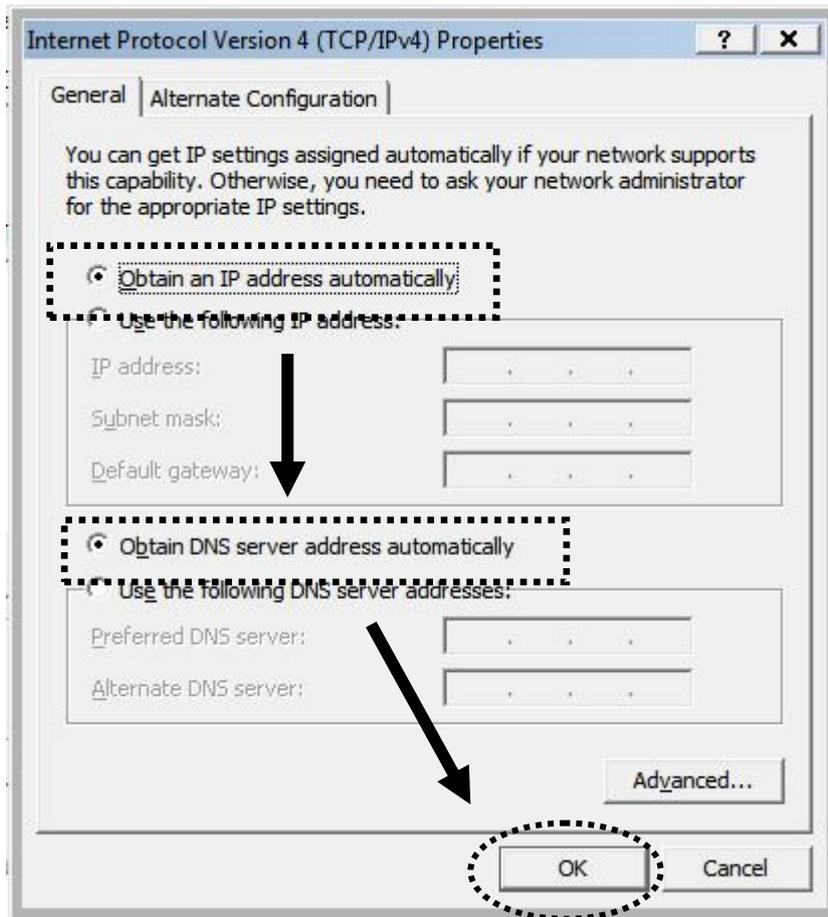

II-2-2. Windows Vista

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel”. Click “View Network Status and Tasks”, then click “Manage Network Connections”. Right-click “Local Area Network”, then select “Properties”. The “Local Area Connection Properties” window will then appear, select “Internet Protocol Version 4 (TCP / IPv4)”, and then click “Properties”.

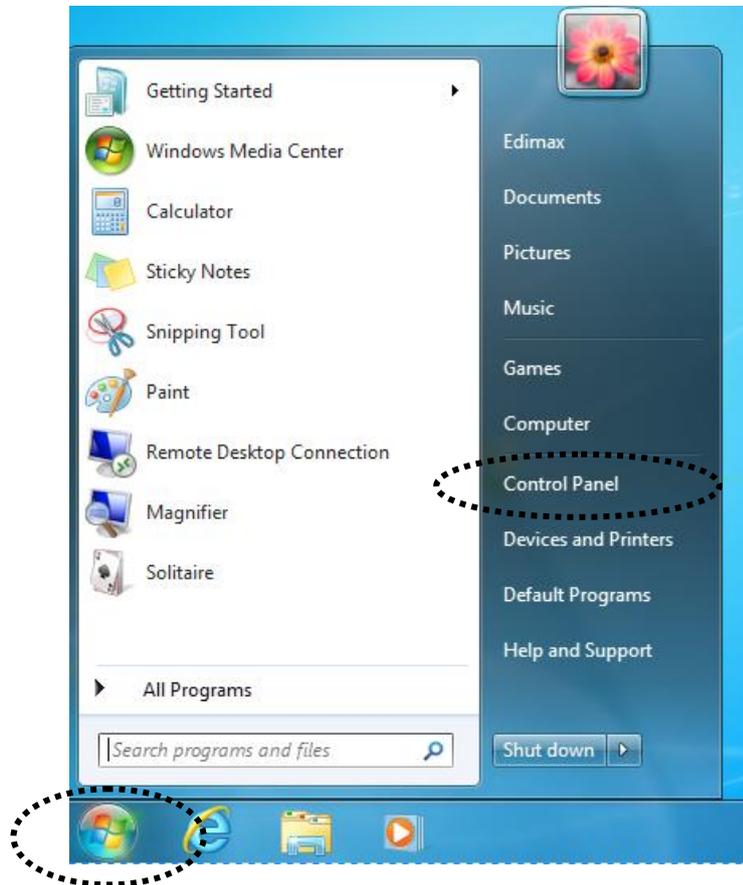

2. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”, then click “OK”.

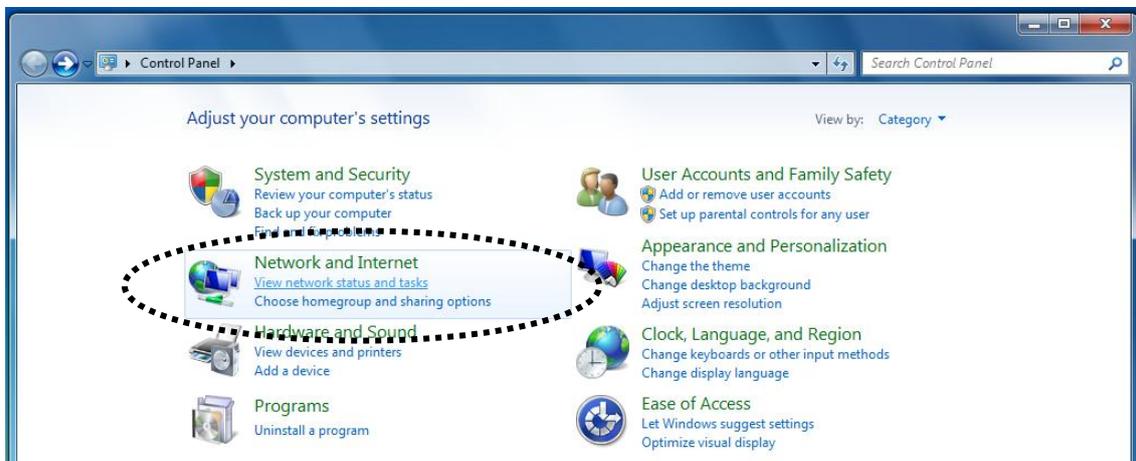

II-2-3. Windows 7

1. Click the “Start” button (it should be located in the lower-left corner of your computer), then click “Control Panel”.

2. Under “Network and Internet” click “View network status and tasks”.

3. Click “Local Area Connection”.

View your basic network information and set up connections

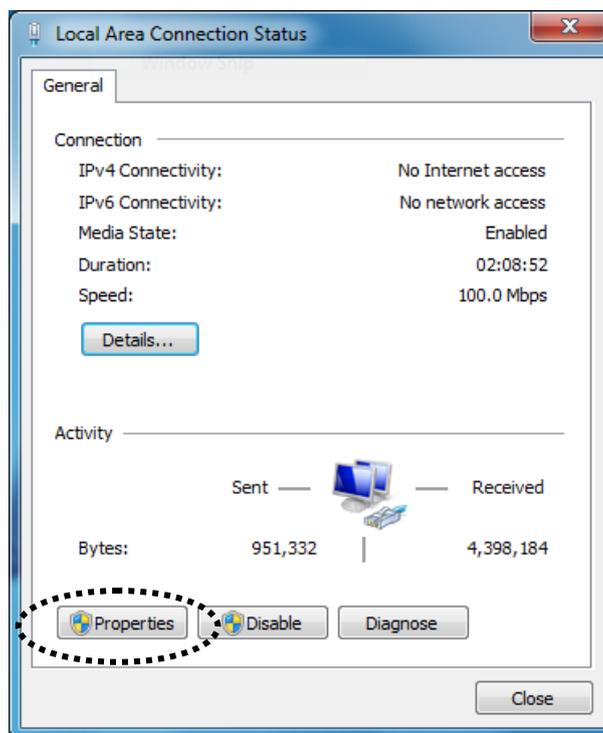

TS-WIN7 (This computer) — Home network — Internet

View your active networks — Connect or disconnect

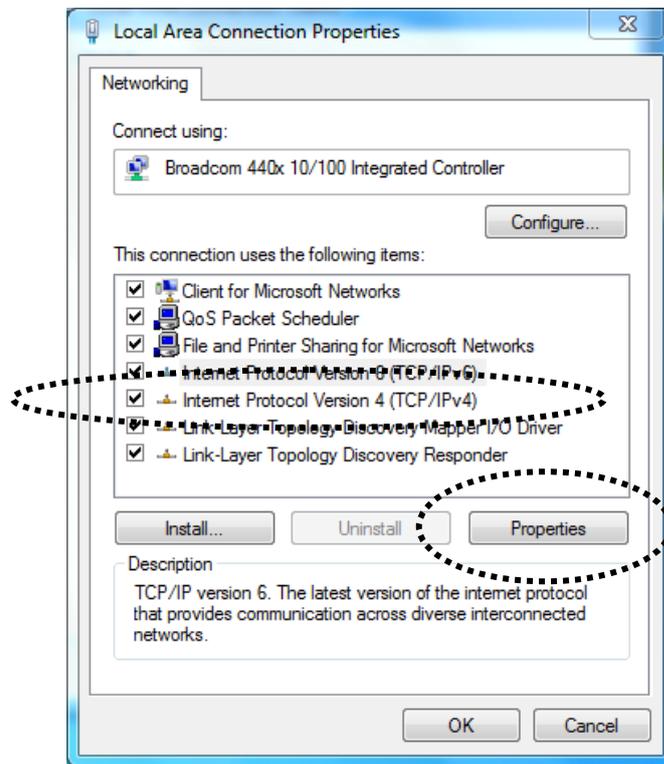

Home network
Home network

Access type: No Internet access
HomeGroup: Ready to create
Connections: Local Area Connection

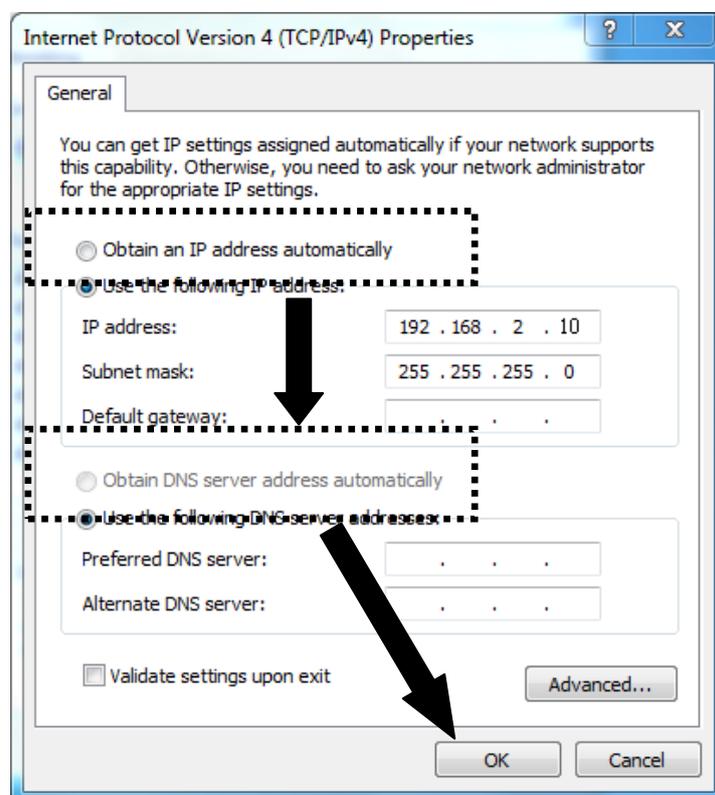

4. Click “Properties”.

5. Select “Internet Protocol Version 4 (TCP/IPv6)” and then click “Properties”.

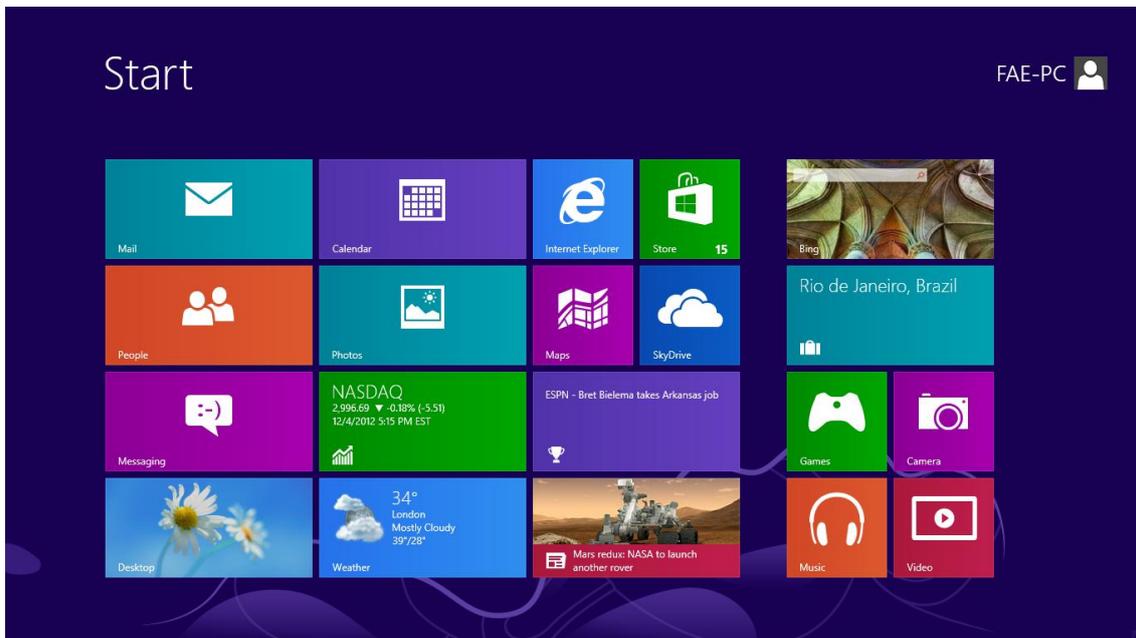

6. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”, then click “OK”.

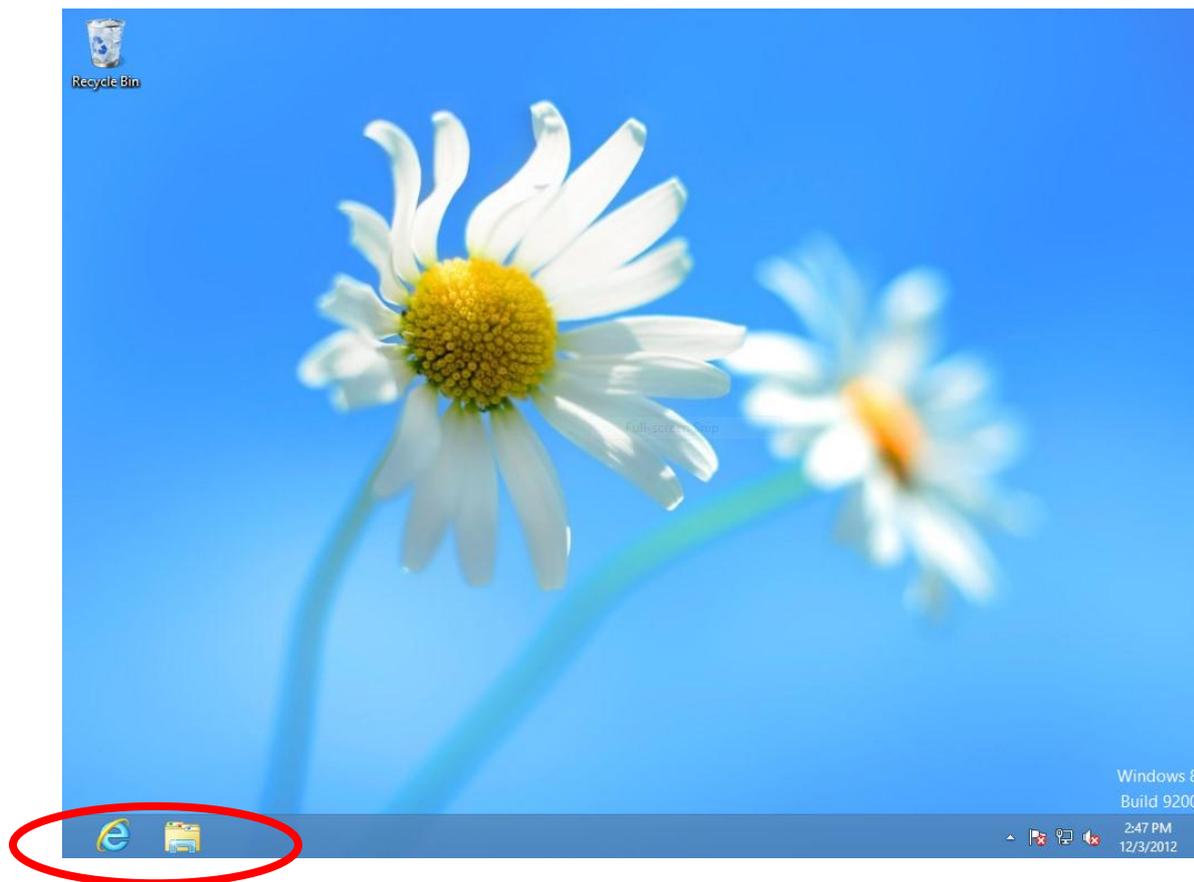

II-2-4. Windows 8

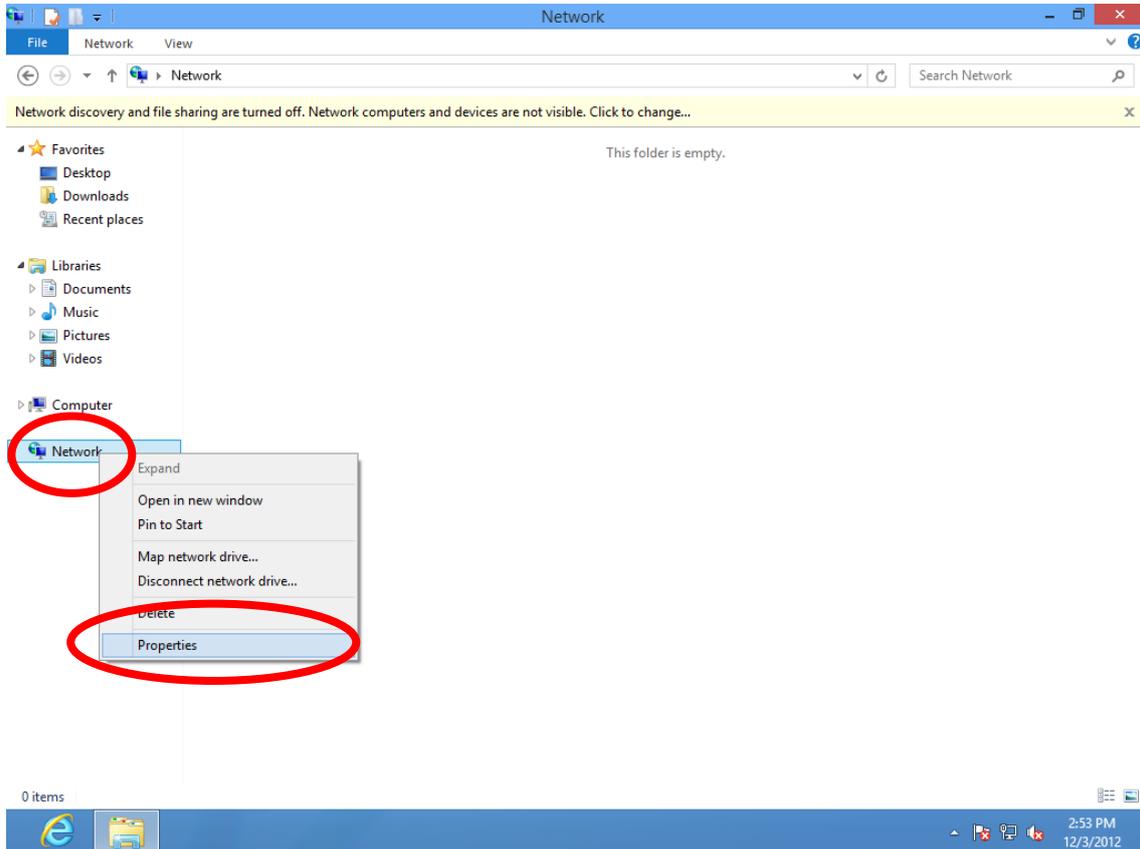

1. From the Windows 8 Start screen, you need to switch to desktop mode. Move your cursor to the bottom left of the screen and click.

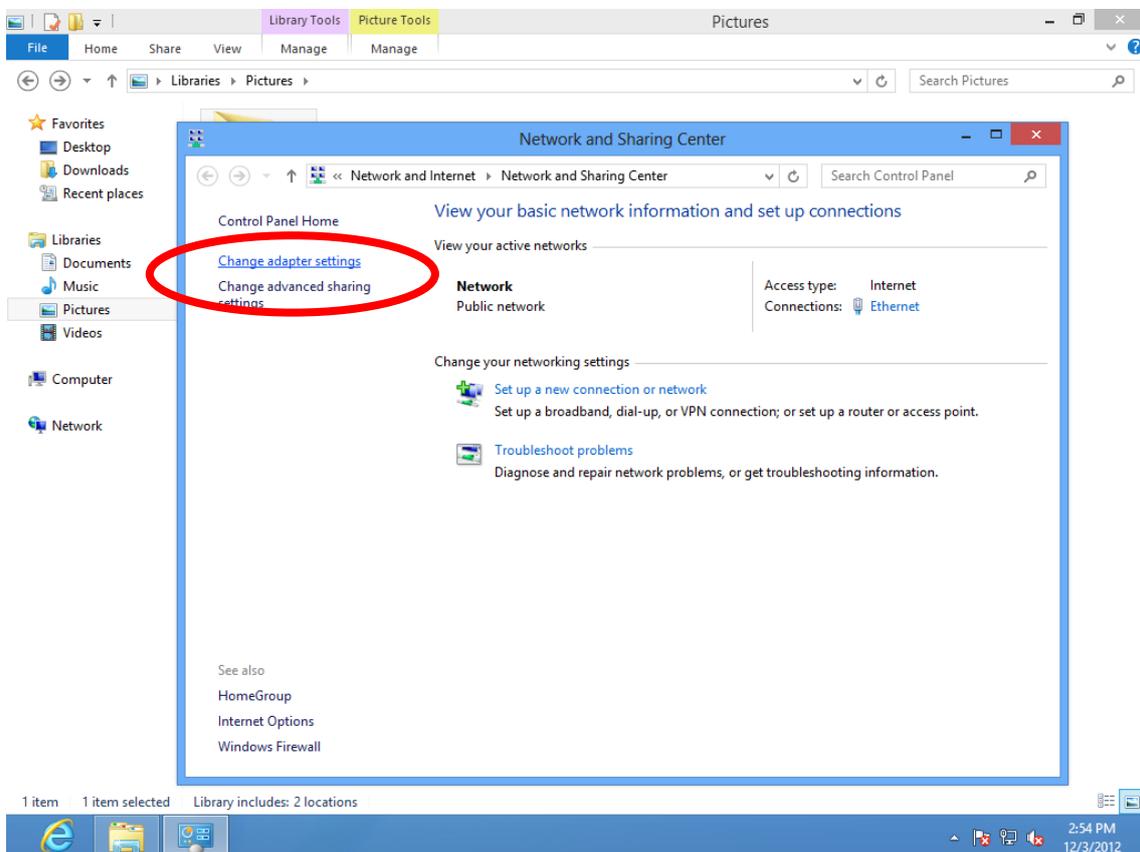

2. In desktop mode, click the File Explorer icon in the bottom left of the screen, as shown below.

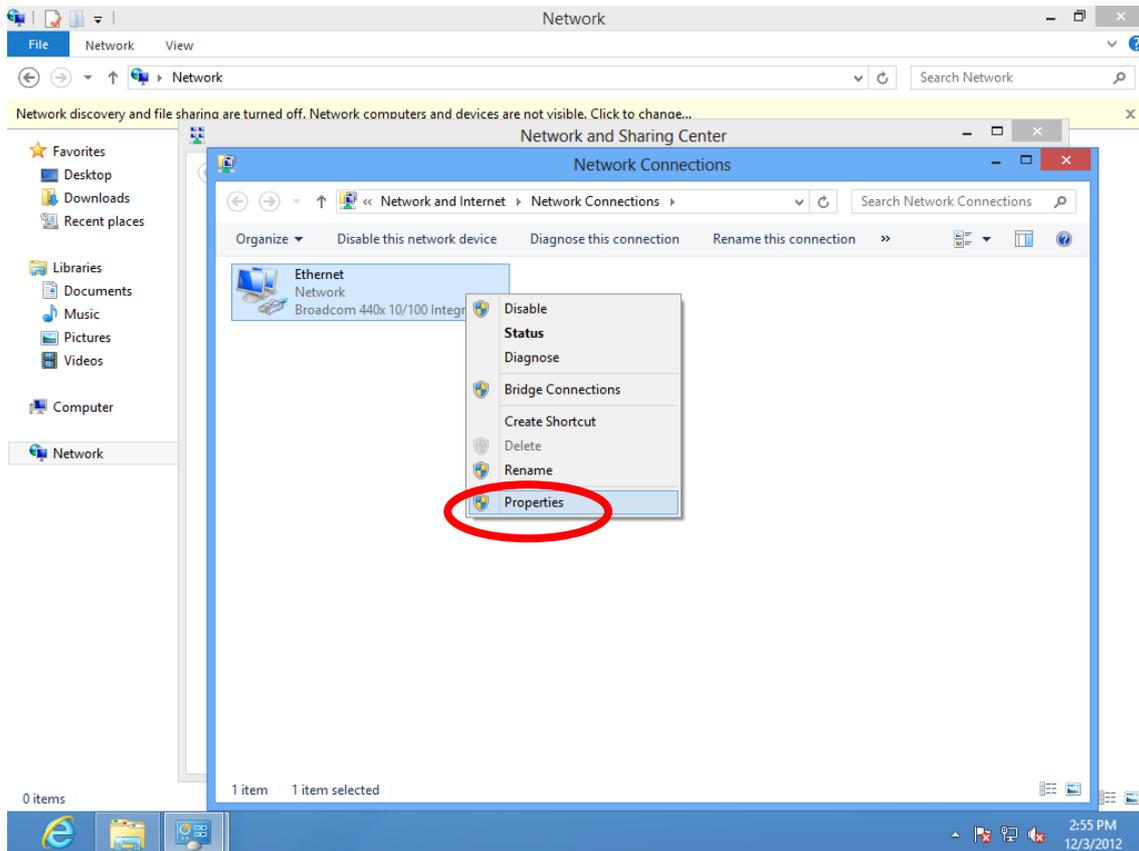

3. Right click "Network" and then select "Properties".

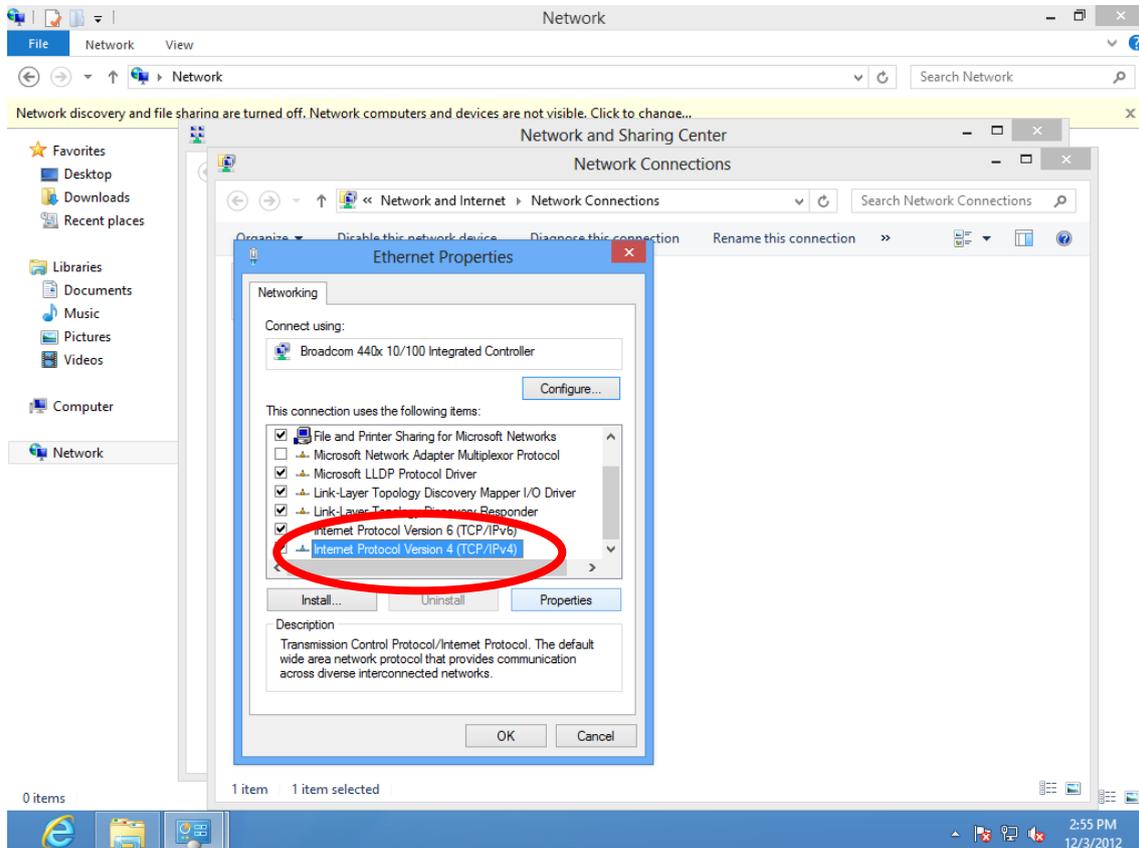

4. In the window that opens, select “Change adapter settings” from the left side.

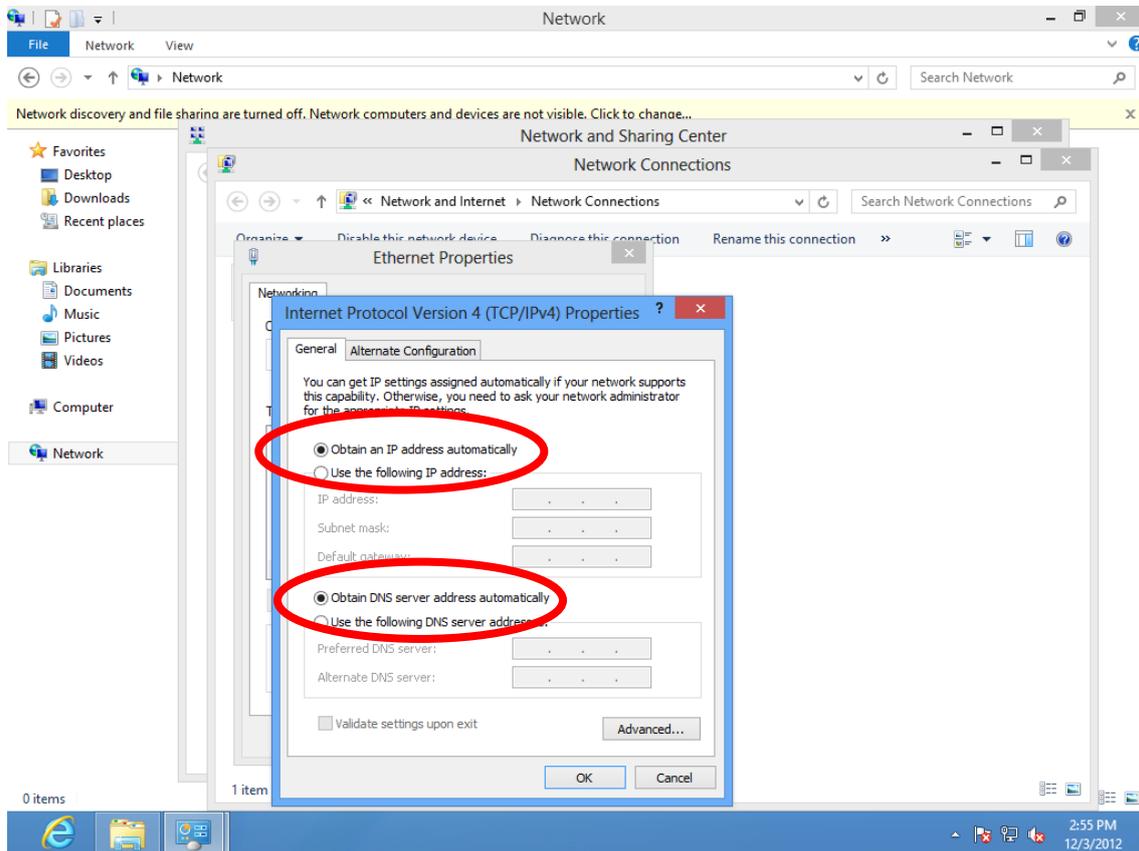

5. Choose your connection and right click, then select “Properties”.

6. Select “Internet Protocol Version 4 (TCP/IPv6)” and then click “Properties”.

7. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”, then click “OK”.

III. SETTING UP

III-1. iQ Setup

iQ Setup is a simple and intelligent WAN detection tool. Please follow the instructions below.

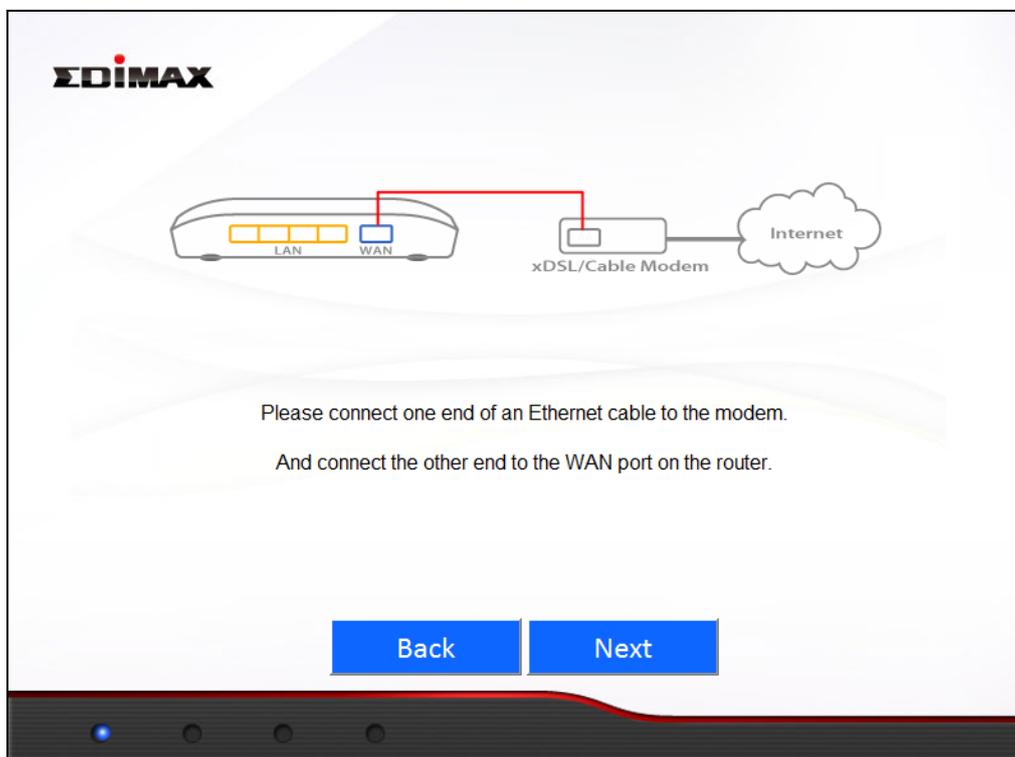

1. Use a Wi-Fi device (e.g. computer, tablet, smartphone) to search for a Wi-Fi network with the SSID “edimax.setup” and connect to it.
2. Open a web browser and if you do not automatically arrive at the “Get Started” screen shown below, enter the URL <http://edimax.setup>. Select your language from the drop down menu and click “Get Started” to begin the setup process.

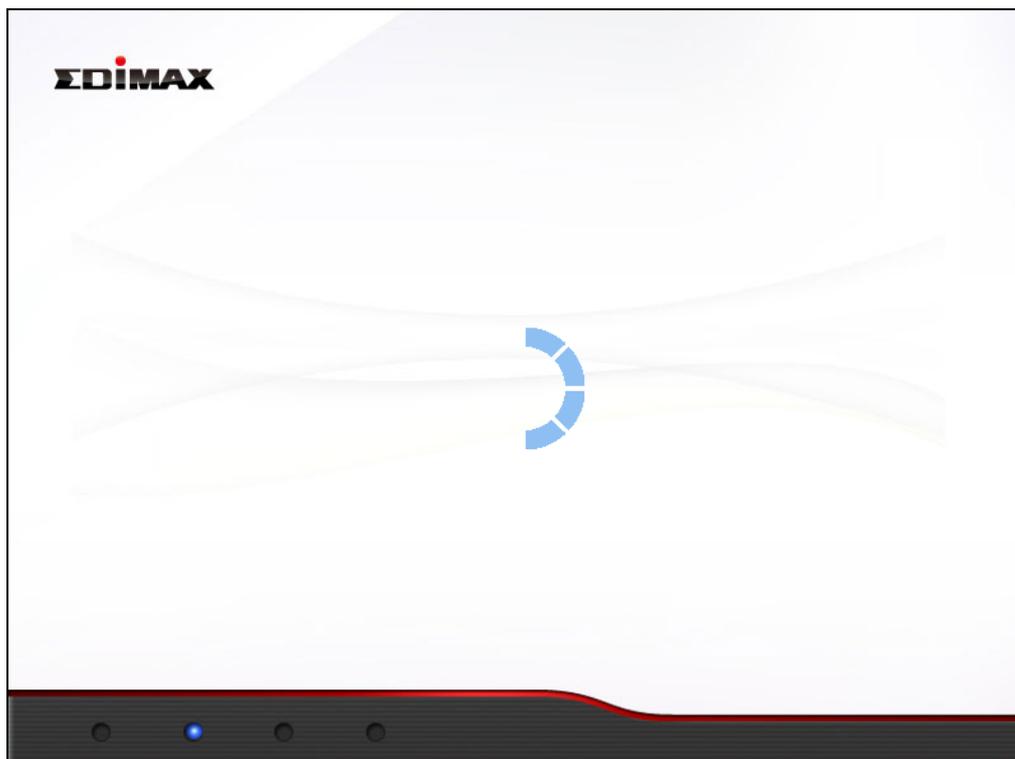

Note: If you cannot access <http://edimax.setup>, please make sure your computer is set to use a dynamic IP address. See II. NETWORK SETTINGS

3. Ensure that your router is properly connected to your modem as shown on the screen, and click “Next” to continue.

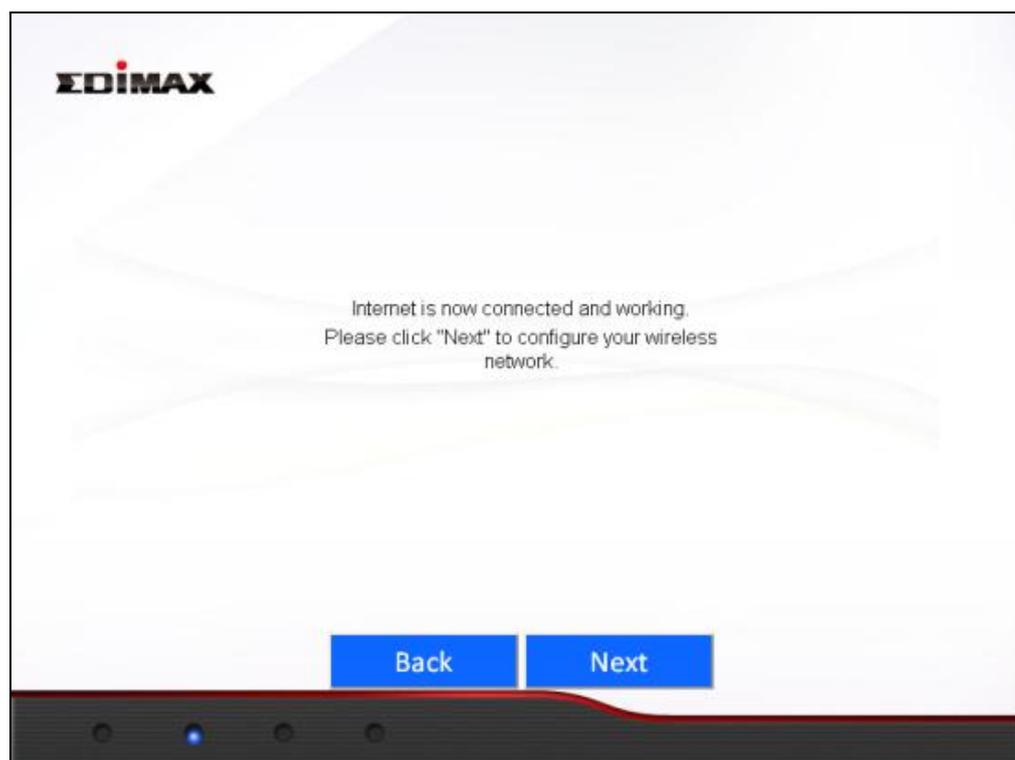

4. Please wait a moment while the BR-6478AC detects your WAN connection type.

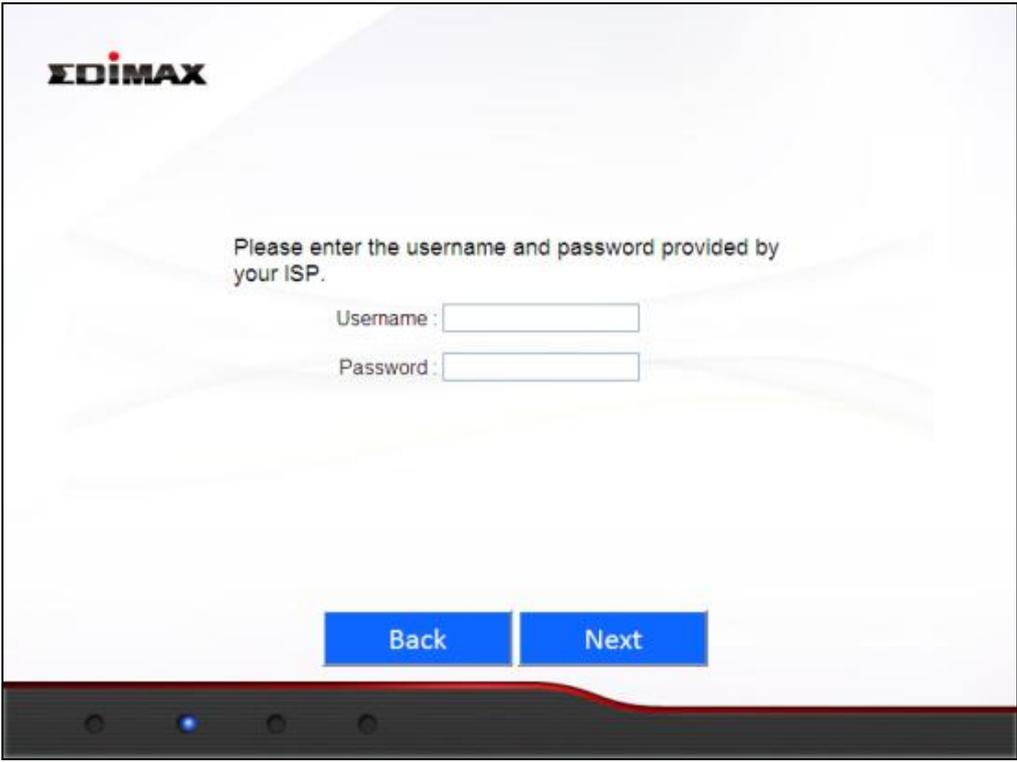

5. The BR-6478AC will display the next screen depending on your WAN connection type.

 For **Dynamic IP** users please click **“Next”** to continue:

 For **PPPoE** users please enter the username and password provided by your ISP and click **“Next”** to continue:

The image shows the EDIMAX configuration interface for PPPoE. At the top left is the EDIMAX logo. The main text reads: "Please enter the username and password provided by your ISP." Below this text are two input fields: "Username:" followed by a text box, and "Password:" followed by a text box. At the bottom of the form are two blue buttons labeled "Back" and "Next". The interface is displayed on a device screen with a dark grey bottom bar containing four circular indicators, the second of which is lit blue.

 For **other** users please select your WAN connection type manually from the drop down menu, click **“Next”** to continue and follow the on-screen instructions.

Note: *If you are not sure which WAN connection type to choose, please contact your ISP.*

The image shows the EDIMAX configuration interface for selecting a WAN connection type. At the top left is the EDIMAX logo. The main text reads: "Please select your internet service type. If you are not sure, please contact your Internet Service Provider (ISP)." Below this text is a dropdown menu. The dropdown is open, showing the following options: "Dynamic IP" (selected), "Dynamic IP", "Static IP", "PPPoE", "PPTP", and "L2TP". At the bottom of the form are two blue buttons labeled "Back" and "Next". The interface is displayed on a device screen with a dark grey bottom bar containing four circular indicators, the second of which is lit blue.

6. Please enter a network name (SSID) and Wi-Fi Password for each of the BR-6478AC's 2.4GHz and 5GHz Wi-Fi networks and click **"Next"** to continue.

Note: Please remember these details. For your convenience, you can write them down at the end of this QIG in **"Wi-Fi Settings"**.

EDIMAX

Please make sure you setup your network name and Wi-Fi password.

Network name (SSID, 2.4G) : edimax.setup

Wi-Fi password : 12345678
(at least 8 characters)

Network name (SSID, 5G) : edimax.setup

Wi-Fi password : 12345678
(at least 8 characters)

Back Next

7. You will see the screen below, displaying a summary of your W-Fi settings and that configuration is now complete. Please click **"Next"** to continue.

The configuration is complete. Please click on "Next" to restart the router.

Internet Type : Dynamic IP

Network name (SSID, 2.4G) : edimax.setup

Wi-Fi password : 12345678

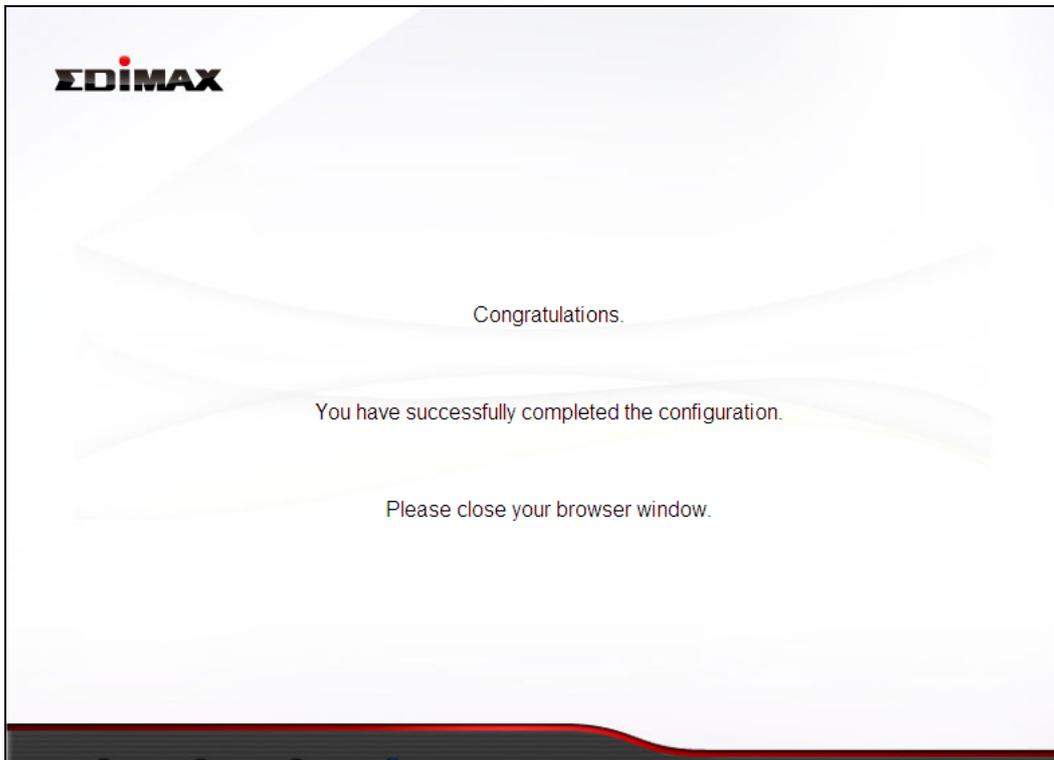

Network name (SSID, 5G) : edimax.setup

Wi-Fi password : 12345678

Backup this configuration

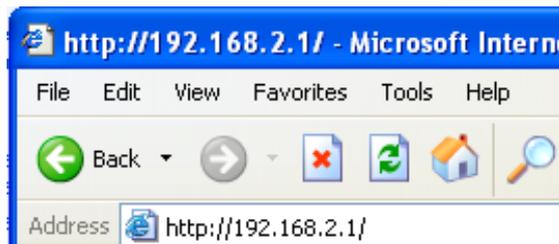

Back Next

8. You will see a final “Congratulations” screen and configuration is now complete. Please close your browser window.

III-2. Manual Setup via Web Browser

1. Enter “192.168.2.1” in the web browser’s address bar and press “Enter”.

2. Input the username “admin” and the password “1234” and click “OK”..

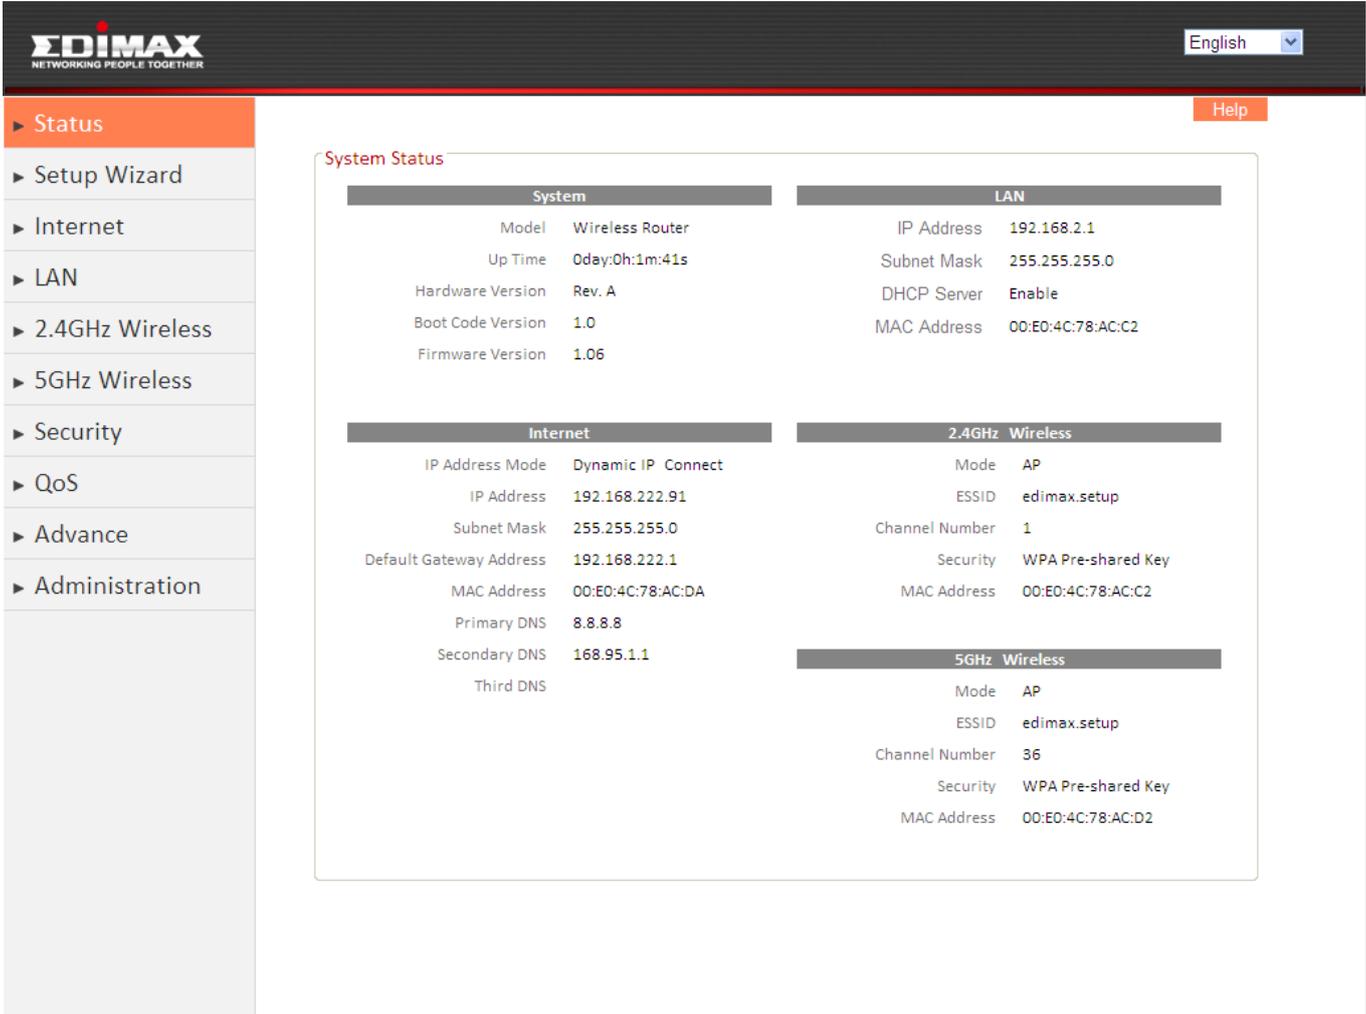

3. Input the username “admin” and the password “1234” and click “OK”. You will arrive the at Status page, use the menu on the left side of the screen to navigate. You can also change the language using the drop down menu in the top right corner. Refer to **IV. BROWSER BASED CONFIGURATION INTERFACE.**

IV. BROWSER BASED CONFIGURATION INTERFACE

Once you have setup the router as detailed in III-1. **iQ Setup** or the included **QIG**, you can further configure the settings of the router or run iQ Setup again using the browser based configuration interface. If you prefer, you can also skip iQ Setup and configure the router manually.

IV-1. Status

The Status page shows the basic status and information of the router.

The screenshot shows the EDIMAX web interface. The top navigation bar includes the EDIMAX logo, a language dropdown set to 'English', and a 'Help' button. The left sidebar contains a menu with the following items: Status (selected), Setup Wizard, Internet, LAN, 2.4GHz Wireless, 5GHz Wireless, Security, QoS, Advance, and Administration. The main content area is titled 'System Status' and is divided into five sections:

System	
Model	Wireless Router
Up Time	Oday:0h:1m:41s
Hardware Version	Rev. A
Boot Code Version	1.0
Firmware Version	1.06

LAN	
IP Address	192.168.2.1
Subnet Mask	255.255.255.0
DHCP Server	Enable
MAC Address	00:E0:4C:78:AC:C2

Internet	
IP Address Mode	Dynamic IP Connect
IP Address	192.168.222.91
Subnet Mask	255.255.255.0
Default Gateway Address	192.168.222.1
MAC Address	00:E0:4C:78:AC:DA
Primary DNS	8.8.8.8
Secondary DNS	168.95.1.1
Third DNS	

2.4GHz Wireless	
Mode	AP
ESSID	edimax.setup
Channel Number	1
Security	WPA Pre-shared Key
MAC Address	00:E0:4C:78:AC:C2

5GHz Wireless	
Mode	AP
ESSID	edimax.setup
Channel Number	36
Security	WPA Pre-shared Key
MAC Address	00:E0:4C:78:AC:D2

Note: Screenshots shown in this manual are examples. The information you see on your screen will be unique to your configuration.

IV-2. Setup Wizard

To perform iQ Setup again and reconfigure the router, select “Setup Wizard” from the menu on the left side.

You will see the screen below. Please refer back to **III-I iQ Setup** onwards for guidance on iQ Setup.

The screenshot shows the Edimax web interface. The top navigation bar includes the Edimax logo and a language dropdown set to 'English'. A left sidebar contains menu items: Status, Setup Wizard (circled in red), Internet, LAN, 2.4GHz Wireless, 5GHz Wireless, Security, QoS, Advance, and Administration. The main content area is titled 'System Status' and contains five tables of configuration data.

System

IV-3. Internet

IV-3-1. WAN Setup

Select a Wide Area Network (WAN) connection mode from the drop down menu. After you select your connection mode and complete the configuration, the router will restart for the changes to take effect.

Note: *If you are not sure which WAN connection mode you should use, please contact your Internet Service Provider (ISP).*

Dynamic IP	Select “Dynamic IP” if your Internet Service Provider assigns an IP address to you automatically using DHCP (Dynamic Host Configuration Protocol) (e.g. cable internet providers).
Static IP	Select “Static IP” if your ISP provides you with a fixed IP address.
PPPoE	Select “PPPoE” if your ISP provides internet access via Point-to-Point Protocol over Ethernet (PPPoE) (usually ADSL users).
PPTP	Select “PPTP” if your ISP provides internet access via Point-to-Point Tunneling Protocol (PPTP).
L2TP	Select “L2TP” if your ISP provides internet access via Layer 2 Tunneling Protocol (L2TP)
WISP	Select “WISP” if your ISP provides wireless internet access.

IV-3-1-1. Dynamic IP

Obtain an IP address automatically:

Host Name Input the host name of your computer (only required if your ISP instructs you to do so).

MAC Address If your ISP only permits computers with certain MAC

addresses to access the internet, input the MAC address of your computer here. If your computer is connected to internet via cable modem, click “Clone Mac address” to enter the MAC address automatically.

Use the following IP address:

Static IP Address	Input the static IP address assigned by your ISP.
Subnet Mask	Input the subnet mask assigned by your ISP.
Default Gateway Address	Input the default gateway address assigned by your ISP.
MAC Address	If your ISP only permits computers with certain MAC addresses to access the internet, input the MAC address of your computer here. If your computer is connected to internet via cable modem, click “Clone Mac address” to enter the MAC address automatically.
DNS address	Select “Obtain an IP address automatically” or “Use the following IP address”. If you choose “Use the following IP address”, you will need to complete the “DNS1 Address”, “DNS2 Address” and “DNS3 Address” fields below.
DNS1	Input the address of DNS1 assigned by your ISP.
DNS2	Input the address of DNS2 assigned by your ISP.
DNS3	Input the address of DNS3 assigned by your ISP.

Enable Dual Wan Access:

If your ISP provides a dual-WAN service, then check the box “Enable Dual Wan Access” and enter the required information.

PPTP Setting:

User ID	Input the user ID assigned by your ISP.
Password	Input the password assigned by your ISP.
PPTP Gateway	Input the PPTP gateway assigned by your ISP.
Connection ID	Input the connection ID assigned by your ISP. (usually not use)
MTU	Input the MTU (maximum transmission unit) value of your network connection. The default value is 1392.
Connection Type	Select connection type from:

Idle Time Out “Continuous” – always connected.
 “Connect on Demand” – connect when required.
 “Manual” – connect and disconnect manually.
 For “Connect on Demand” connection type, specify the length of inactivity required to disconnect.

BEZEQ-ISRAEL Check this box to enable use with the BEZEQ network in Israel.

IV-3-1-5. WISP

The screenshot shows the configuration interface for WISP. At the top, 'WAN Connection Mode' is set to 'WISP'. Below this, the 'WISP' section contains several settings: 'Enable / Disable' has the 'Enable' radio button selected; 'Basic Settings' includes an empty 'ESSID' text box; 'Site Survey' has '2.4G' selected with a '5G' option and a 'Select Site Survey' button; 'Channel Number' has an empty text box; 'Security Setting' has 'Encryption' set to 'Disable' in a dropdown menu. At the bottom are 'Save', 'Apply', and 'Cancel' buttons.

Select “Enable” or “Disable” to enable/disable the WISP function accordingly.

ESSID Enter the ESSID of the WISP network, or click “Select Site Survey” to view all available networks and select the WISP network.

Site Survey Select “2.4G” or “5G” to specify the 2.4GHz or 5GHz frequency band for the site survey.

Channel Number Enter the channel number of the WISP network.

Encryption If your WISP service uses encryption, select “Enable” from the drop down menu and enter the appropriate information.

IV-3-2. DDNS

Dynamic DNS (DDNS) is a service which provides a hostname-to-IP service for dynamic IP users. The changing nature of dynamic IPs means that it can be

difficult to access a service provided by a dynamic IP user; a DDNS service though can map such dynamic IP addresses to a fixed hostname, for easier access. The router supports several DDNS service providers, for more details and to register for a DDNS account please visit the DDNS providers website(s), examples of which are listed below.

Enable/Disable	Select “Enable” or “Disable” to enable/disable DDNS.
Provider	Select DDNS service provider.
Domain Name	Enter the domain name provided by the DDNS provider.
Account/E-Mail	Please enter the Account or Email which has been applied from DDNS provider.
Password/Key	Please enter the Password or Key which has been applied from DDNS provider.

This router supports the following DDNS services:

- 3322 <http://www.3322.org>
- DHS <http://www.dhs.org>
- DynDNS <http://www.dyndns.org>
- ODS <http://ods.org>
- TZO <http://www.tzo.com>
- GnuDIP <http://gnudip2.sourceforge.net>
- DyNS <http://www.dyns.cx/>
- ZoneEdit <http://www.zoneedit.com>
- DHIS <http://www.dhis.org/>
- CyberGate <http://cybergate.planex.co.jp/ddns/>
- NS2GO <http://www.ns2go.com/>
- NO-IP <http://www.noip.com/>

IV-4. LAN

Here you can configure your Local Area Network (LAN). You can enable the router to dynamically allocate IP addresses to your LAN clients, and you can modify the IP address of the router.

LAN IP

IP Address	<input type="text" value="192.168.2.1"/>
Subnet Mask	<input type="text" value="255.255.255.0"/>
802.1d Spanning Tree	<input type="button" value="Disable"/>
DHCP Server	<input type="button" value="Enable"/>
Lease Time	<input type="button" value="Forever"/>

DHCP Server

Start IP	<input type="text" value="192.168.2.100"/>
End IP	<input type="text" value="192.168.2.200"/>
Domain Name	<input type="text"/>

Static DHCP Lease Table

Only 16 sets of addresses are allowed.

NO.	MAC Address	IP Address	Select
-----	-------------	------------	--------

Enable Static DHCP Leases

<input type="button" value="New"/>	<input type="text" value="MAC Address"/>	<input type="text" value="IP Address"/>	<input type="button" value="Add"/> <input type="button" value="Clear"/>
------------------------------------	--	---	---

IP Address	Specify an IP address here. This IP address will be assigned to your router and will replace the default IP address.
Subnet Mask	Specify a subnet mask – the default value is 255.255.255.0
802.1d Spanning Tree	Select “Enable” or “Disable” to enable/disable 802.1d Spanning Tree. This creates a tree of connected layer-2 bridges (typically Ethernet switches) within a mesh network, and disables those links that are not part of the tree, leaving

DHCP Server	a single active path between any two network nodes. Select “Enable” or “Disable” to enable/disable DHCP server accordingly.
Lease Time	Select a lease time for the DHCP leases here. The DHCP client will obtain a new IP address after the period expires. If there are less than 30 computers connected to the router, you can select “Forever”.
Start IP	Input the start IP address for the DHCP server’s IP address leases.
End IP	Input the end IP address for the DHCP server’s address leases.
Domain Name	Input the end IP address for the DHCP server’s address leases.
Enable Static DHCP Leases	Check this box to enable static DHCP leases (up to 16 leases).

IV-5. 2.4GHz Wireless

You can setup the 2.4GHz wireless LAN connection on this page.

The screenshot shows the Edimax router's configuration interface for 2.4GHz wireless LAN. The left sidebar contains navigation options: Status, Setup Wizard, Internet, LAN, 2.4GHz Wireless (selected), 5GHz Wireless, Security, QoS, Advance, and Administration. The main content area is titled '2.4GHz Wireless' and is divided into two sections:

- Basic Settings:**
 - Disable Wireless
 - Mode: AP
 - Band: 2.4 GHz (b+g+n)
 - Wireless Network Name (ESSID): edimax.setup
 - Broadcast ESSID: Enable Disable
 - Channel Number: Auto
 - Wireless Clients: Show list
- Wireless Security:**
 - Encryption: WPA Pre-shared Key
 - WPA Unicast Cipher Suite: WPA (TKIP) WPA2 (AES) WPA2 Mixed
 - Pre-shared Key Format: Passphrase
 - Pre-shared Key: [masked] Hide

At the bottom of the configuration area are three buttons: Save, Apply, and Cancel.

IV-5-1. Basic Settings

Basic Settings

Disable Wireless

Mode: AP

Band: 2.4 GHz (b+g+n)

Wireless Network Name (ESSID): edimax.setup

Broadcast ESSID: Enable Disable

Channel Number: Auto

Wireless Clients:

Wireless Security

Encryption: WPA Pre-shared Key

WPA Unicast Cipher Suite: WPA (TKIP) WPA2 (AES) WPA2 Mixed

Pre-shared Key Format: Passphrase

Pre-shared Key: ●●●●●● Hide

Mode	Select a mode from the drop down menu: AP, Station-Infrastructure, AP Bridge-Point to Point, AP Bridge-Point to Multi-Point, AP Bridge-WDS, Universal Repeater.
Wireless Standard	Select a wireless standard from: 2.4GHz(b+g+n) 2.4GHz(b) 2.4GHz(g) 2.4GHz(n) 2.4GHz(b+g)
Wireless Network name	Specify a name for your router/wireless network for identification. The default ESSID is name “edimax.setup”.
Broadcast ESSID	Select “Enable” or Disable” to enable or disable ESSID broadcast accordingly. When enabled, the ESSID will be visible as an available Wi-Fi network. When disabled, the ESSID will still be available but not visible.

Channel Number

Select a channel number or set to “Auto”. North America uses channels 1–11 and Europe uses channels 1–13.

Wireless Clients

Click the “Show List” button to show the list of all connected wireless clients. Click “Refresh” in the new window to refresh the list or click “Close” to close the window.

Active Wireless Client Table

This table shows the MAC address, transmission and reception packet counters for each associated wireless client.

MAC Address	802.11 PhyMode	Tx Packets	Rx Packets	Tx Rate (Mbps)	Power Saving	Expired Time (s)
00:1b:77:51:d9:26	11g	9728	48	36	yes	300

Encryption

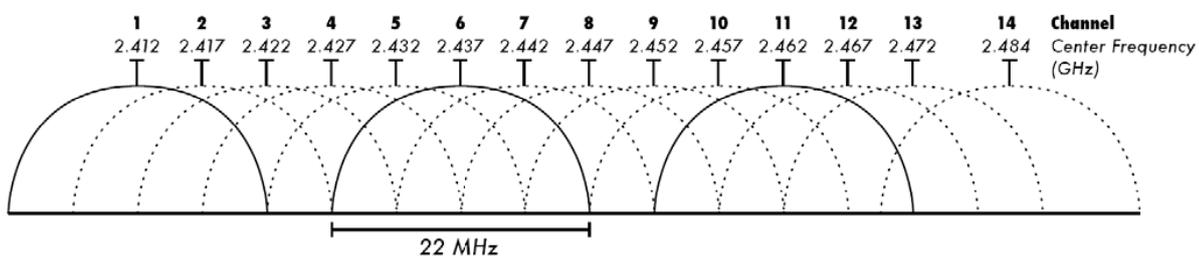

Select an encryption type from the drop down menu. “WPA Pre-shared Key” is recommended. Refer to the following pages for more details on each encryption type.

Wireless Standard - IEEE 802.11b/g/n

For best performance, 2.4GHz(b+g+n) is recommended for indoor environments. For long distance data transmission, 2.4GHz(11b) is recommended.

Channel Number

Channel numbers vary depending on your country. The table below is intended as a guide if you wish to manually set the channel number for the 2.4GHz network.

Channel	Frequency (MHz)	China	North America	Europe	Japan	Australia	Israel
1	2412	Y	Y	Y	Y	Y	N
2	2417	Y	Y	Y	Y	Y	N
3	2422	Y	Y	Y	Y	Y	Y
4	2427	Y	Y	Y	Y	Y	Y

5	2432	Y	Y	Y	Y	Y	Y
6	2437	Y	Y	Y	Y	Y	Y
7	2442	Y	Y	Y	Y	Y	Y
8	2447	Y	Y	Y	Y	Y	Y
9	2452	Y	Y	Y	Y	Y	Y
10	2457	Y	Y	Y	Y	Y	N
11	2462	Y	Y	Y	Y	Y	N
12	2467	Y	N	Y	Y	Y	N
13	2472	Y	N	Y	Y	Y	N
14	2484	N	N	N	Only 802.11b	N	N

IV-5-1-1. Wireless Security

WPA Pre-shared key is the recommended and most secure encryption type.

IV-5-1-1-1. WEP

Key Length	Select 64-bit or 128bit. Using 128-bit is more secure than 64-bit.
Key Format	Choose from ASCII or Hex.
Default Tx Key	You can set up to four sets of WEP keys, and select which is used as the default. The default value is "Key 1".
Encryption Key	Enter 4 sets of encryption keys here.
Enable 802.1x Authentication	Enable/disable 802.1x user authentication.

IV-5-1-1-2. WPA pre-shared key

Wireless Security

Encryption: WPA Pre-shared Key

WPA Unicast Cipher Suite: WPA (TKIP) WPA2 (AES) WPA2 Mixed

Pre-shared Key Format: Passphrase

Pre-shared Key: ●●●●●● Hide

WPA Unicast Cipher Suite Select from WPA (TKIP), WPA2 (AES) or WPA2 Mixed. WPA2 (AES) is safer than WPA (TKIP), but not supported by all

wireless clients. Please make sure your wireless client supports your selection. WPA2 (AES) is recommended followed by WPA2 Mixed if your client does not support WPA2 (AES).

Pre-shared key format

Select the pre-shared key format from “Passphrase” (8 to 63 alphanumerical characters) or “Hex (64 characters 0 to 9 and a to f.)

Pre-shared Key

Please enter a key according to the format you selected above. A complex, hard-to-guess key is recommended.

IV-5-1-1-3. WPA RADIUS

WPA RADIUS is a combination of WPA encryption and RADIUS user authentication. If you have a RADIUS authentication server, you can authenticate the identity of every wireless client against a user database.

The screenshot shows a configuration window titled "Wireless Security". It contains several fields and options:

- Encryption:** A dropdown menu set to "WPA RADIUS".
- WPA Unicast Cipher Suite:** Three radio button options: "WPA (TKIP)", "WPA2 (AES)" (which is selected), and "WPA2 Mixed".
- RADIUS Server IP address:** An empty text input field.
- RADIUS Server Port:** A text input field containing the value "1812".
- RADIUS Server Password:** An empty text input field.

WPA Unicast Cipher Suite

Select from WPA (TKIP), WPA2 (AES) or WPA2 Mixed. WPA2 (AES) is safer than WPA (TKIP), but not supported by all wireless clients. Please make sure your wireless client supports your selection. WPA2 (AES) is recommended followed by WPA2 Mixed if your client does not support WPA2 (AES).

RADIUS Server IP address

Input the IP address of the RADIUS authentication server here.

RADIUS Server Port

Input the port number of the RADIUS authentication server here.

RADIUS Server Password

The default value is 1812.

Input the password of the RADIUS authentication server here.

IV-5-2. Guest Wireless Settings

Here you can setup a “Guest” wireless network which permits users to browse the Internet but doesn’t allow users to modify the router’s settings – ideal for guests in your home or office. Check the box “Enable Guest SSID” to enable this network, then enter the necessary information in the fields below.

Guest Basic Settings

Enable Guest SSID

Wireless Guest Name

Enable Wireless Clients Isolation

Band (Same as main SSID)

Channel Number (Same as main SSID)

Guest Wireless Security

Encryption

Enable 802.1x Authentication

Wireless Guest Name

Enter a name to identify the guest wireless network. The default value is “edimax.guest”.

Wireless Clients Isolation

Check the box to enable wireless clients isolation.

Band

This value is the same as for the main SSID and can not be modified.

Channel Number

This value is the same as for the main SSID and can not be modified.

Guest Wireless Security

Configure the wireless security settings for the guest network, in the same way as explained in **IV-5-1-1. Wireless Security** for the main SSID.

IV-5-3. WPS

WPS

Enable WPS

Wi-Fi Protected Setup Information :

WPS Status	Configured
Self Pin Code	29769629
SSID	edimax.setup
Authentication Mode	WPA Pre-shared Key
Authentication Key	12345678

Device Configuration :

Configuration Mode: Registrar

Configure via Push Button: Start PBC

Configure via Client Pin Code: Start PIN

WPS (Wi-Fi Protected Setup) provides an easy and secure way to establish the connection between BR-6478AC and wireless clients. Any WPS-compatible wireless clients can establish secure connection with BR-6478AC using simple push-button type configuration or Pin Code type configuration.

We recommend you use WPA2 encryption with WPS.

1. Ensure you have already configured SSID and WPA2 encryption settings. When you use WPS the connection will be configured according to these settings.
2. Click "Start PBC" or press the WPS button on the router.
3. Activate WPS on the wireless client within 2 minutes to establish a connection.

IV-5-4. Access Control

Access Control is a security feature that can help to prevent unauthorized users from connecting to your wireless router.

This function allows you to define a list of wireless devices permitted to connect to the router. Devices are each identified by their unique MAC address. If a device which is not on the list of permitted MAC addresses attempts to

connect to the router, it will be denied.

To enable this function, check the box labeled “Enable Access Control”.

Access Control

Enable Wireless Access Control

MAC Address: >> Comment:

MAC Address	Device Name	IP Address	Comment	Select
				<input type="button" value="Delete Selected"/> <input type="button" value="Delete All"/>

IV-5-5. Wireless Schedule

Check the box “Enable Schedule Settings” to enable a wireless schedule. A wireless schedule enables you to automate the wireless network on or off at specified times. Select days, times and commands appropriately to configure your schedule.

The router must remain connected to the internet, and be used together with an NTP Server for this feature to function correctly.

Wireless Schedule

Enable Schedule Settings

1. Weekday Sunday Monday Tuesday Wednesday
 Thursday Friday Saturday

2. Time Hour Minute

3. Command

Weekday	Time	Command	Select

Pre-shared Key Hide

2.5GHz and 5GHz are different frequency bands for your concurrent Wi-Fi networks. The configuration settings for 5GHz are the same as 2.4GHz - for more detailed guidance, please refer back to **IV-5. 2.4G Wireless**. When

selecting which wireless standard to use under “Band”, 5 GHz (A+N+AC) is recommended for best performance.

Note: It is recommended to assign different SSIDs to your 2.4GHz & 5GHz Wi-Fi networks for identification purposes.

The table below is intended as guidance if you wish to manually set a channel number for the 5GHz Wi-Fi network.

Channel	頻率 (MHz)	USA	Europe	Japan		Singapore	China	Taiwan
		20 MHz	20 MHz	20 MHz	10 MHz	20 MHz	20 MHz	20MHz
7	5035	No	No	No	Yes	No	No	No

IV-7. Security

The BR-6478AC's security features provide two functions, "URL Blocking" and "Access Control". "URL Blocking" allows Internet content to be blocked by URL or keyword, while "Access Control" enables you to specify which computer's can or cannot access your network, identified by IP or MAC address.

IV-7-1. URL Blocking

This feature can restrict access to specified websites for computers on your local network, for example as a parental control function.

Check the "Enable URL Blocking" box to enable the function. You can block specific websites or URLs containing a specified keyword. Input the URL/IP address/host name of a website, or your chosen keyword, into the URL/Keyword box field and click "Add".

Blocking / Filtering

Blocking / Filtering URL Blocking ▾

URL Blocking

Enable URL Blocking

URL / Keyword : Add Clear

NO.	URL / Keyword	Select

Delete Selected Delete All

Apply

IV-7-2. Access Control

Access Control is a security feature that can help to prevent unauthorized users from connecting to your wireless router.

This function allows you to define a list of wireless devices permitted or not permitted to connect to the router, identified by their unique MAC address or IP address. If a device which is not on the list of permitted MAC or IP addresses attempts to connect to the travel router, it will be denied.

To enable MAC filtering, check the box labeled “Enable Mac Filtering”.

To enable IP filtering, check the box labeled “Enable IP Filtering”.

Blocking / Filtering

Blocking / Filtering **Access Control** ▾

Access Control

Enable MAC Filtering : Deny Allow

Client PC	MAC Address	Computer Name	Comment

								<input type="button" value="Add PC"/> <input type="button" value="Delete Selected"/> <input type="button" value="Delete All"/>

Enable MAC Filtering Table:

Choose “Deny” or “Allow” next to “Enable MAC Filtering”, to deny or allow a specific MAC address accordingly, then enter the required information.

Enable IP Filtering Table:

Choose “Deny” or “Allow” next to “Enable MAC Filtering”, to deny or allow a specific IP address accordingly, then enter the required information.

IV-8. QoS (Quality of Service)

IV-8-1. QoS

Quality of service (QoS) is a function which allows you to allocate a certain amount of bandwidth to specific computer. This can ensure that applications which require guaranteed bandwidth e.g. video conference or network telephone applications, are able to function properly and without interruption. Conversely, you can also limit the maximum bandwidth available to a specific computer or application.

Check the “Enable QoS” box to enable this function and then enter the desired values.

QoS

Enable QoS

Total Download Bandwidth kbits

Total Upload Bandwidth kbits

Current QoS Table :

Priority	Rule Name	Upload Bandwidth	Download Bandwidth	Select
----------	-----------	------------------	--------------------	--------

Total Download Bandwidth

Set the limit of total download bandwidth in kbits. To disable download bandwidth limitation, input “0” here.

Total Upload Bandwidth

Set the limit of total upload bandwidth in kbits. To disable upload bandwidth limitation, input “0” here.

Current QoS Table

The current QoS rule table.

When you assign a particular bandwidth guarantee/limit to a specific computer, it is known as a rule. Existing rules will be listed in the table “Current QoS Table”.

QoS Rule settings :

Click “Add” and to create a new rule in a new window.

QoS

This page allows users to add/modify the QoS rule's settings.

Rule Name

Bandwidth kbits

Local IP Address -

Local Port Range

Remote IP Address -

Remote Port Range

Traffic Type

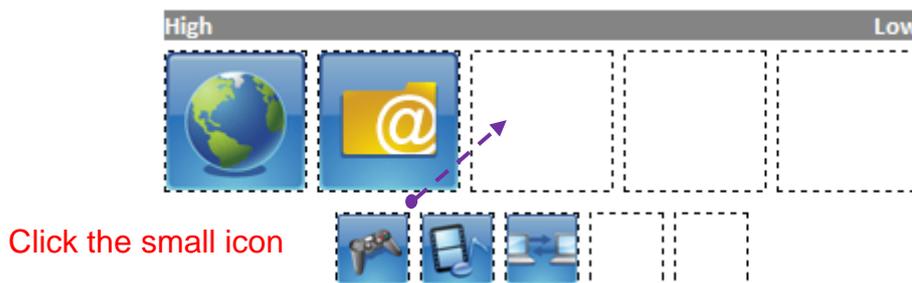

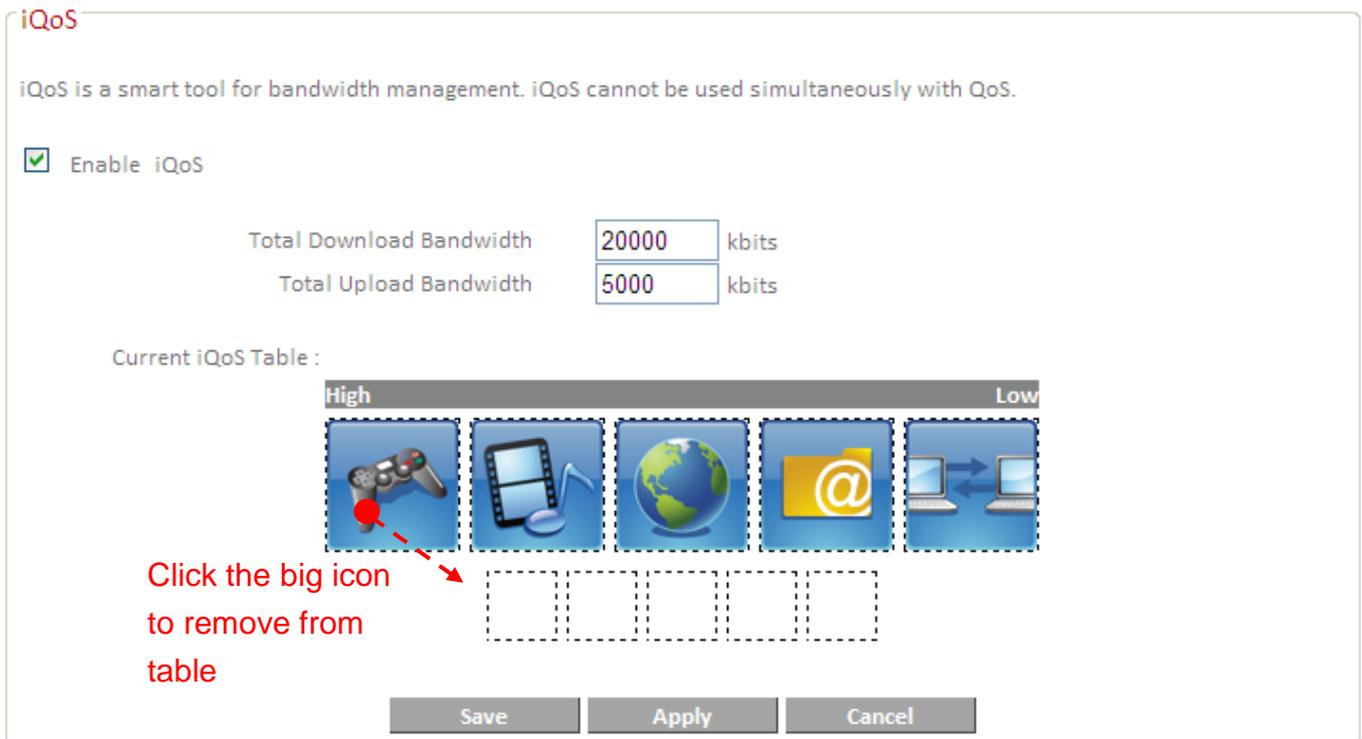

Protocol

Rule Name	Input a unique name for this QoS rule for reference.
Bandwidth	Download/upload bandwidth (guarantee or maximum).
Local IP Address	Set the IP address range that will be affected by this QoS rule. If only one IP address is involved, input the IP address in the left field only.
Local Port Range	Set the port range that will activate this QoS rule. If only one port is involved, input a single number here (1 to 65535); if multiple ports are involved, input starting/ending port number in x-y format (e.g. 10-20).
Remote IP Address	Set remote IP addresses that will trigger this QoS rule (if only one IP address is involved, input the IP address in the left field only).
Remote Port Range	Set the remote port range that will activate this QoS rule.
Traffic Type	If you're creating a QoS rule for a specific type of traffic, select it from this menu and a port range (above) is not required.
Protocol	Select the protocol type here (TCP or UDP).

IV-8-2. iQoS

iQoS is a more intuitive and automated tool to manage internet bandwidth than manually configuring the settings using QoS. For online gamers, or users with bandwidth requirements for audio/video, iQoS is useful and effective function.

iQoS cannot be used in conjunction with QoS and vice-versa. When one is enabled, the other is automatically disabled.

Check the box "Enable iQoS" to enable this feature. Specify the total upload and download bandwidth and then arrange the network application icons in priority order. Network applications are grouped into the following five categories:

Internet
Browsing

P2P/ BT
Download

FTP

Multimedia
Transmission

Online
Gaming

The priority table (large icons) is ordered from left to right, high to low priority. Double click a large icon to remove it from the priority table, and the other large icons will move left. Double click a small icon to insert the icon to the highest priority vacancy in the table. All spaces in the priority table must be filled.

IV-9. Advanced

IV-9-1. Static Routing

Static routing is a method of configuring path selection of routers, characterized by the absence of communication between routers regarding the current topology of the network. The opposite of static routing is dynamic routing, sometimes also referred to as adaptive routing.

You can configure static routing and manually add routes to the routing table on this page.

Static Routing

Enable Static Routing

Destination LAN IP	Subnet Mask	Default Gateway	Hop Count	Interface
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	LAN ▼

Current Static Routing Table :

NO	Destination LAN IP	Subnet Mask	Default Gateway	Hop Count	Interface	Select

IV-9-2. Port Forwarding

This function allows you to redirect a single port or consecutive ports of an internet IP address to the same port of a local IP address. The port number(s) of the internet IP address and local IP address must be the same.

If the port number of the internet IP address and local IP address is different, please use the “Virtual Server” function instead.

Port Forwarding

Enable Port Forwarding

Private IP	Computer Name	Type	Port Range	Comment

IV-9-8. DMZ

A Demilitarized Zone (DMZ) is an isolated area in your local network where private IP addresses are mapped to specified internet IP addresses, allowing unrestricted access to the private IP addresses but not to the wider local network.

You can define a virtual DMZ host here. This is useful for example, if a network client PC cannot run an application properly from behind an NAT firewall, since it opens the client up to unrestricted two-way access.

DMZ

Enable DMZ

Public	Client PC	Computer Name
<input checked="" type="radio"/> Dynamic IP <input type="text" value="Session 1"/>	<input type="text"/>	<input type="button" value="<<"/> <input type="text" value="----Select----"/> <input type="button" value="v"/>
<input type="radio"/> Static IP <input type="text"/>		

Current DMZ Table :

NO	Computer Name	Public IP Address	Client PC IP Address	Select
<input type="button" value="Delete Selected"/> <input type="button" value="Delete All"/>				

-
- Public IP Address You can select 'Dynamic IP' or 'Static IP' here. If you select 'Dynamic IP', you have to select an Internet connection session from dropdown menu; if you select 'Static IP', please input the IP address that you want to map to a specific private IP address.
 - Client PC IP address Input the private IP address that the internet IP address will be mapped to.
 - Add Click "Add" to add the client to the "Current DMZ Table".
 - Reset Clear all values.
-

IV-9-9. Firewall

The router supports firewall functions which can protect your network and computer from malicious intruders.

Denial-of-Service (DoS) is a common form of malicious attack against a network. The router's firewall can protect against such attacks.

If you are not familiar with these functions, it is recommended you keep the default settings.

Firewall

The router provides stateful packet inspection (SPI) firewall protection. Only packets matching a known active connection will be allowed by the firewall; others will be rejected.

SPI firewall Enable Disable

DoS

Ping of Death Ping of Death Packet(S) Per Burst

Ping of Death	Specify the frequency of ping of death packets which will trigger the router's DoS protection function.
Discard Ping from WAN	Check this box and the router will not answer ping requests from the internet.
Port Scan	Intruders use "port scanners" to detect open internet IP address ports. Check each type of port scan to prevent.
Sync Flood	Specify the frequency of sync flood packets which will trigger the DoS protection function.

IV-9-10. UPnP

Universal plug-and-play (UPnP) is a set of networking protocols which enables network devices to communicate and automatically establish working configurations with each other.

Set Time Zone	Select the time zone of your country or region.
Time Server Address	The travel router supports NTP (Network Time Protocol) for automatic time and date setup. Input the host name or IP address of the IP server manually.
Daylight Saving	If your country/region uses daylight saving time, please check the “Enable Function” box, and select the start and end date.

IV-10-2. Password

You can change the password used to login to the browser-based configuration interface here. It is advised to do so for security purposes.

Password

Current Password

New Password

Confirmed Password

Current Password	Enter your current password.
New Password	Enter your new password.
Confirmed Password	Confirm your new password.

IV-10-3. Remote Access

Check “Enabled” to enable the remote access feature and then input the required values.

Remote Access

Host IP Address

Port

Enabled

Host IP Address	Specify the IP address allowed remote access.
Port	Specify a port number (0–65535) used for remote access.

IV-10-4. Backup / Restore

Backup / Restore

Backup Settings

Restore Settings

Restore to Factory Default

Backup Settings

Click “Save” to save the current settings on your computer as config.bin file.

Restore Settings

Click the browse button to find a previously saved config.bin file and then click “Upload” to replace your current settings.

Restore to Factory Default

Click “Reset” to restore settings to the factory default. A pop-up window will appear and ask you to confirm and enter your log in details. Enter your username and password and click “Ok”. See below for more information.

IV-10-5. Upgrade

This page allows you to upgrade the firmware for the BR-6478AC. After the upgrade, the system will restart.

Upgrade

IV-10-6. Restart

In the event that the router malfunctions or is not responding, then it is recommended that you restart the device.

Restart

In the event that the system stops responding correctly or stops functioning, you can perform a system restart. Your settings will not be changed. To restart, click on the APPLY button below. You will be asked to confirm your decision. The restart will be complete when the Internet LED light stops blinking.

Apply

IV-10-7. Logs

Here you can view the system status/system log and security log.

V. TROUBLESHOOTING

If you are experiencing problems with your router, please refer to this troubleshooting guide before contacting your dealer of purchase for help.

Note: *If you are experiencing problems immediately after a firmware upgrade, please contact your dealer of purchase for help.*

Scenario	Solution
I can't log onto the browser-based configuration interface.	<ul style="list-style-type: none"> a. Please check that the router is correctly powered and check the LEDs on the front panel. If the router is initializing after being switched off or restarted, wait for a 2 minutes and try again. b. Make sure you are using the full, correct URL: http://edimax.setup c. If you are using a MAC or IP address filter, try to connect the router using a different computer. d. Set your computer to obtain an IP address automatically (DHCP), and see if your computer can obtain an IP address.
I can't log onto the browser-based configuration interface: incorrect password.	<ul style="list-style-type: none"> a. Password is case-sensitive. Make sure the "Caps Lock" light is not illuminated. b. If you do not know your password, restore the device to factory settings.
I can't establish a connection to my router.	<ul style="list-style-type: none"> a. If encryption is enabled, please re-check WEP or WPA passphrase settings on your wireless client. The password is case-sensitive. Make sure the "Caps Lock" light is not illuminated. b. Try moving closer to the router. c. Switch off the router and switch it back on after 10 seconds. e. Please check that the router is correctly inserted into a power socket and check the LEDs on the front panel.
File downloads are very slow or frequently interrupted.	<ul style="list-style-type: none"> a. Reset the router. b. Try again later. Your local network may be experiencing technical difficulties or very high usage.

	c. Change channel number.
The router is extremely hot.	<p>a. It is normal for the router to heat up during frequent use. If you can safely place your hand on the router, the temperature of the device is at a normal level.</p> <p>b. If you smell burning or see smoke coming from router then disconnect the extender immediately, as far as it is safely possible to do so. Call your dealer of purchase for help.</p>
My network device can't access the Internet.	<p>a. Ensure that your broadband router is fully functional.</p> <p>b. Switch off both your network device and router and switch back on again.</p> <p>c. Ensure that the router is powered on (check the PWR LED).</p>
Can I use the same SSID as my current gateway router for my Wi-Fi extender?	Yes, but it is not recommended as it will be difficult to distinguish between two SSIDs with the same name.
The date and time of event logs are incorrect.	Check the internal clock of the router and adjust if necessary.

VI. GLOSSARY

Default Gateway (Wireless bridge): Every non-access point IP device needs to configure a default gateway's IP address. When the device sends out an IP packet, if the destination is not on the same network, the device has to send the packet to its default gateway, which will then send it out towards the destination.

DHCP: Dynamic Host Configuration Protocol. This protocol automatically gives every computer on your home network an IP address.

DNS Server IP Address: DNS stands for Domain Name System, which allows Internet servers to have a domain name (such as `www.Broadbandaccess point.com`) and one or more IP addresses (such as `192.34.45.8`). A DNS server keeps a database of Internet servers and their respective domain names and IP addresses, so that when a domain name is requested (as in typing "`Broadbandaccess point.com`" into your Internet browser), the user is sent to the proper IP address. The DNS server IP address used by the computers on

your home network is the location of the DNS server your ISP has assigned to you.

DSL Modem: DSL stands for Digital Subscriber Line. A DSL modem uses your existing phone lines to transmit data at high speeds.

Ethernet: A standard for computer networks. Ethernet networks are connected by special cables and hubs, and move data around at up to 10/100 million bits per second (Mbps).

IP Address and Network (Subnet) Mask: IP stands for Internet Protocol. An IP address consists of a series of four numbers separated by periods, that identifies a single, unique Internet computer host in an IP network. Example: 192.168.2.1. It consists of 2 portions: the IP network address, and the host identifier.

The IP address is a 32-bit binary pattern, which can be represented as four cascaded decimal numbers separated by “.”: aaa.aaa.aaa.aaa, where each “aaa” can be anything from 000 to 255, or as four cascaded binary numbers separated by “.”: bbbbbbbb.bbbbbbbb.bbbbbbbb.bbbbbbbb, where each “b” can either be 0 or 1.

A network mask is also a 32-bit binary pattern, and consists of consecutive leading 1’s followed by consecutive trailing 0’s, such as 11111111.11111111.11111111.00000000. Therefore sometimes a network mask can also be described simply as “x” number of leading 1’s.

When both are represented side by side in their binary forms, all bits in the IP address that correspond to 1’s in the network mask become part of the IP network address, and the remaining bits correspond to the host ID.

For example, if the IP address for a device is, in its binary form, 11011001.10110000.10010000.00000111, and if its network mask is, 11111111.11111111.11110000.00000000

It means the device’s network address is

11011001.10110000.10010000.00000000, and its host ID is, 00000000.00000000.00000000.00000111. This is a convenient and efficient method for access points to route IP packets to their destination.

ISP Gateway Address: (see ISP for definition). The ISP Gateway Address is an IP address for the Internet access point located at the ISP's office.

ISP: Internet Service Provider. An ISP is a business that provides connectivity to the Internet for individuals and other businesses or organizations.

LAN: Local Area Network. A LAN is a group of computers and devices connected together in a relatively small area (such as a house or an office). Your home network is considered a LAN.

MAC Address: MAC stands for Media Access Control. A MAC address is the hardware address of a device connected to a network. The MAC address is a unique identifier for a device with an Ethernet interface. It is comprised of two parts: 3 bytes of data that corresponds to the Manufacturer ID (unique for each manufacturer), plus 3 bytes that are often used as the product's serial number.

NAT: Network Address Translation. This process allows all of the computers on your home network to use one IP address. Using the broadband access point's NAT capability, you can access the Internet from any computer on your home network without having to purchase more IP addresses from your ISP.

Port: Network Clients (LAN PC) uses port numbers to distinguish one network application/protocol over another. Below is a list of common applications and protocol/port numbers:

Application	Protocol	Port Number
Telnet	TCP	23
FTP	TCP	21
SMTP	TCP	25
POP3	TCP	110
H.323	TCP	1720
SNMP	UCP	161
SNMP Trap	UDP	162
HTTP	TCP	80
PPTP	TCP	1723
PC Anywhere	TCP	5631
PC Anywhere	UDP	5632

Access point: A access point is an intelligent network device that forwards packets between different networks based on network layer address information such as IP addresses.

Subnet Mask: A subnet mask, which may be a part of the TCP/IP information provided by your ISP, is a set of four numbers (e.g. 255.255.255.0) configured like an IP address. It is used to create IP address numbers used only within a particular network (as opposed to valid IP address numbers recognized by the Internet, which must be assigned by InterNIC).

TCP/IP, UDP: Transmission Control Protocol/Internet Protocol (TCP/IP) and Unreliable Datagram Protocol (UDP). TCP/IP is the standard protocol for data transmission over the Internet. Both TCP and UDP are transport layer protocol. TCP performs proper error detection and error recovery, and thus is reliable. UDP on the other hand is not reliable. They both run on top of the IP (Internet Protocol), a network layer protocol.

WAN: Wide Area Network. A network that connects computers located in geographically separate areas (e.g. different buildings, cities, countries). The Internet is a wide area network.

Web-based management Graphical User Interface (GUI): Many devices support a graphical user interface that is based on the web browser. This means the user can use the familiar Netscape or Microsoft Internet Explorer to Control/configure or monitor the device being managed.
