Chapter 1 Introduction

Thank you for purchasing Tenda W306R/W307R 11N Wireless Broadband Router!

W306R/W307R utilizes advanced MIMO technology and increases over 8 times transmission range of ordinary 802.11g products. Compatible with IEEE802.11n and IEEE802.11g/b standards, it can provide up to 300Mbps stable transmission rate. Additionally, it includes router, wireless access point, four-port switch and firewall in one, dedicated to SOHOs (Small Office/Home Office) and family networking.

It supports WDS (Wireless Distribution System) function for repeating and amplifying the signals to extend the wireless network coverage. Besides, the Router also supports all of the latest wireless security features, such as 64/128-bit WEP, WPA, WPA2, WPA&WPA and WPS (PBC and PIN) encryption methods, packet filtering and port forwarding, to prevent unauthorized access and protect your network against malicious attack.

In addition, URL and MAC address filtering can take it easy for parents and network administrator to manage network life and QoS bandwidth control over specific

computer's downloading speed is supported as well. Moreover, UPnP and WMM support can smooth your MSN voice better, and the included Setup Wizard on CD-ROM will be easy and fast for non-savvy users to install the device and access to the Internet.

1.1 Product Features

- Includes router, wireless access point, four-port switch and firewall in one
- Provides up to 300Mbps uploading and downloading speed
- Supports two WPS (Wi-Fi Protected Setup) encryption methods: PBC and PIN
- Compliant to IEEE802.11n, IEEE802.11g, IEEE802.11b, IEEE802.3 and IEEE802.3u standards
- Supports over 8 times transmission range of 11G products
- Supports 64/128-bit WEP, WPA, WPA2, WPA&WPA2 encryption methods
- Supports RTS/CTS protocol and data partitioning function
- Provides one 10/100Mbps Auto-Negotiation Ethernet WAN port
- Provides four 10/100Mbps Auto-Negotiation Ethernet LAN ports

- Supports xDSL/Cable MODEM, static and dynamic IP in community networking
- Supports remote/local Web management
- Supports WMM to better smooth your voice and video
- Supports SSID stealth mode and access control based over MAC address (up to 30 entries)
- Supports Auto MDI/MDIX
- Supports wireless Roaming technology for high-efficient wireless connections
- Supports auto negotiation/manual mode for 802.11b/802.11g/802.11n
- Supports UPnP and DDNS
- Supports Firefox 1.0, IE5.5 or above
- Supports SNTP
- Supports virtual server, DMZ host
- Built-in firewall for hacker's attack prevention
- Supports DHCP server/client
- Supports auto wireless channel selection
- Supports LAN access control to the Internet
- Provides syslog to record the status of the router
- Supports WDS wireless network extension
- Supports QoS function
- Detachable antenna (only for W306R)

1.2 Package Contents

Please unpack the box and check the following items:

- One W306R/W307R 11N Wireless Broadband Router
- One Quick Installation Guide
- One Power Adapter
- One CD-ROM

If any of listed items are missing or damaged, please contact the Tenda reseller from whom you purchased for replacement immediately.

1.3 LED Indicator and Port Description

Front Panel and LED Indicator Show

LED indicator description on front panel: (from L to R)

- **POWER**
When turns green, Always ON indicates the power connects well.
- **SYS**
When turns green, blinking indicates the system runs well.
- **WPS**
When blinking, it indicates the device is negotiating with client in WPS mode.
- **WLAN**
Wireless signal LED indicator. When turns green, blinking indicates the wireless function is enabled.
- **LAN (4,3,2,1)**
Wired local network LED indicator. Always ON indicates it is connected with Ethernet device; blinking indicates the device is transmitting and/or receiving data.
- **WAN**
Wide area network indicator. Always ON indicates the Router's WAN Port.

Back Panel Show:

Rear Panel: (From L to R)

➤ **POWER**

The jack is for power adapter connection. Please use the included 9V DC power adapter.

➤ **WAN**

A 100Mbps Ethernet port, can be connected with MODEM, Switch, Router and other Ethernet device for Internet connecting to DSL MODEM, Cable MODEM and ISP.

➤ **LAN (1, 2, 3, 4)**

4 10/100Mbps Ethernet ports can be connected with Ethernet switch, Ethernet router and NIC card.

➤ **RESET/WPS**

The combination button for system reset and WPS features. Press this button for 7 seconds, the settings configured in this device will be deleted and it will restore the settings to the default one. Press it for one second, the WPS feature will be enabled.

Chapter 2 Hardware Installation

2.1 How to Install the Router

After you unpack the box, please follow the steps below to connect. For better wireless performance, please put the device in the middle of wireless coverage area.

Please use the included power adapter to power on the Router. **IMPORTANT:** Use of a different power adapter could cause damage and void the warranty for this product.

Please connect the LAN port of the Router to the network adapter of your computer with a cable.

Please connect your broadband line provided by your ISP to the WAN port.

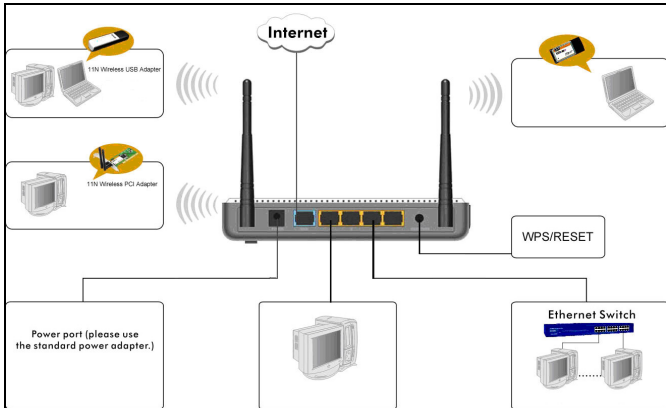

Insert the included CD-ROM into the CD-ROM drive, double click the "Setup" icon and follow the instructions to complete the installation. Or you can enter the Router's Web page to configure it. (More details please refer to Chapter 3.)

2.2 Network Application Plan

Usually wireless LAN Network is deployed in a planned environment where each access point is located in a steady place with certain wireless coverage area for communication service. Generally speaking, it is in the center of the area to reduce “dead spot”.

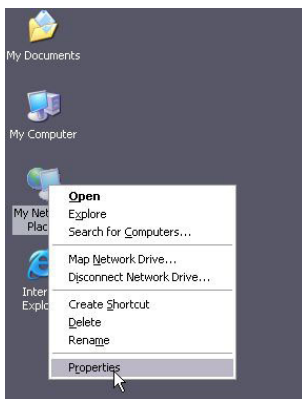

Chapter 3 How to Login to the Router

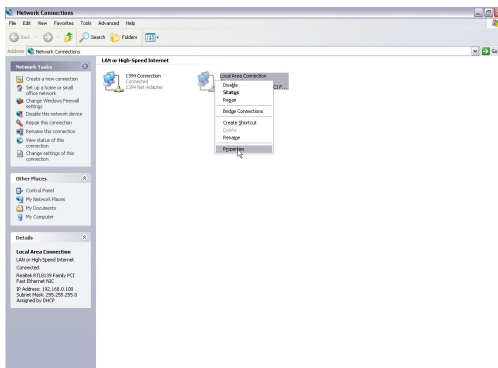

The chapter mainly presents how to enter the Router's Web page. After you have finished the hardware installation, the following steps will assist you to set the network configurations for you computer.

3.1 How to Set the Network Configurations

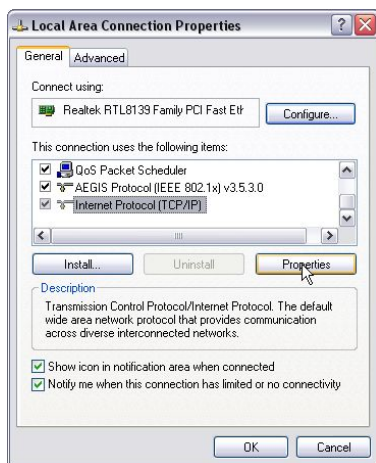

1. On your computer desktop right click "My Network Places" and select "Properties".

2. Right click "Local Area Network Connection" and select "Properties".

3. Select "Internet Protocol (TCP/IP)" and click "Properties".

4. Select “Obtain an IP address automatically” and “Obtain DNS server address automatically”. Click “OK” to save the configurations.

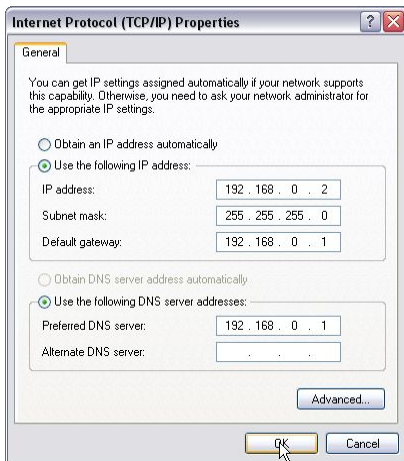

Or select “Use the following IP address” and enter the IP address, Subnet mask, Default gateway as follows:

IP Address: 192.168.0.XXX: (XXX is a number from 2~254)

Subnet Mask: 255.255.255.0

Gateway: 192.168.0.1

Certainly you need to input the DNS server address provided by your ISP. Otherwise, you can use the Router’s default gateway as the DNS proxy server. Click “OK” to save the configurations.

3.2 Login to the Router

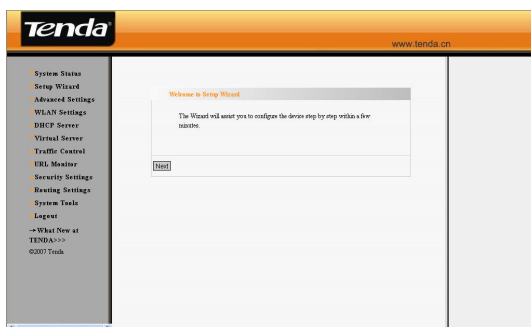

1. To access the Router's Web-based interface, launch a web browser such as Internet Explorer or Firefox and enter the Router's default IP address, `http://192.168.0.1`. Press "Enter".

- Input the "admin" in both User Name and Password.
Click "OK".

- If you enter the correct user name and password, the screen will be the next one.

Chapter 4 Quick Setup Guide

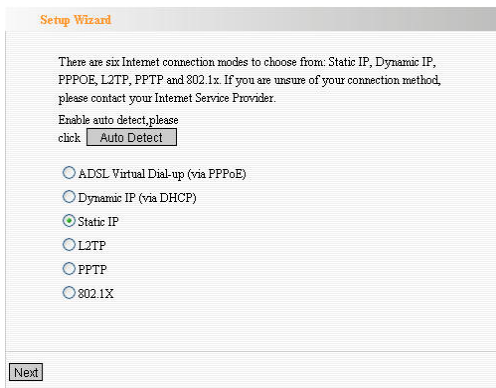

This chapter deals with how to access the Internet quickly. Please follow this guide to connect your Router to the Internet.

4.1 Setup Wizard

Here is the “Welcome to Setup Wizard” for configuring your Router quickly. Click “Next”.

In this screen, select one mode of your Internet connection you use. If you are not clear, press the “Detect” button or contact your Internet Service Provider, and click “Next”.

Setup Wizard

There are six Internet connection modes to choose from: Static IP, Dynamic IP, PPPOE, L2TP, PPTP and 802.1x. If you are unsure of your connection method, please contact your Internet Service Provider.

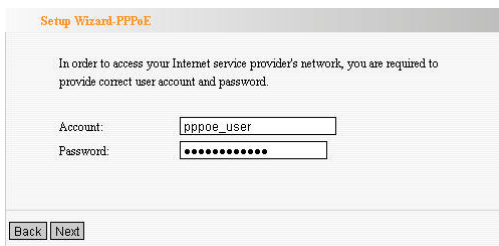

Enable auto detect, please click:

ADSL Virtual Dial-up (via PPoE)
 Dynamic IP (via DHCP)
 Static IP
 L2TP
 PPTP
 802.1X

ADSL Virtual Dial-up (Via PPoE)

Enter the Account and Password provided by your ISP, and click "Next".

For example:

Setup Wizard-PPoE

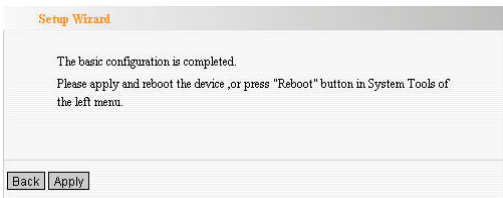

In order to access your Internet service provider's network, you are required to provide correct user account and password.

Account:

Password:

Dynamic IP (Via DHCP)

If your connection mode is Dynamic IP, it means your IP address keeps changing every time you connect. You do not need to enter the information like other modes. Click "Next" and "Save" to finish the settings.

Static IP

In this screen, fill the network address information from your ISP in the IP Address, Subnet Mask, Gateway and Primary DNS server fields and click "Next".

For example:

ISP provides the following TCP/IP parameters as follows:

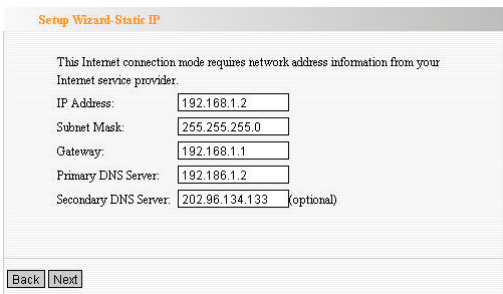

IP Address: 192.168.1.2

Subnet Mask: 255.255.255.0

Gateway: 192.168.1.1

Primary DNS Server: 192.168.1.2

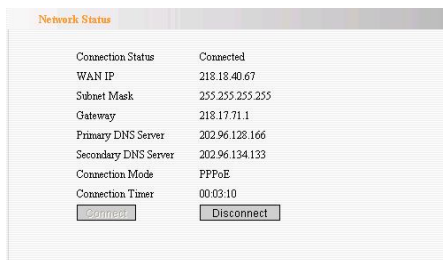

Alternate DNS Server: 202.96.134.133

Click "Save" to complete the setup wizard. The Router will record the settings you made. To activate the settings, it is recommended to select "Reboot the Router" from "System Tool" of the left menu. It is rebooting now, please wait for a few minutes and DO NOT power off it.

Click the "System Status" in the left menu of the Web-based Utility to find out the current network and system information. If the "Connection Status" is "Connected", Congratulations you on completing the Router's basic settings. You are on the Internet now. If you want to configure more, please proceed to the following explanations for Advanced Settings.

L2TP

L2TP Server IP: Enter the Server IP provided by your ISP.

User Name: Enter L2TP username.

Password: Enter L2TP password.

MTU: Maximum Transmission Unit, you may need to change it for optimal performance with your specific ISP. 1400 is the default MTU.

Address Mode: Select "Static" if your ISP supplies you with the IP address, subnet mask, and gateway. In most cases, select Dynamic.

IP Address: Enter the L2TP IP address supplied by your ISP.

Subnet Mask: Enter the Subnet Mask supplied by your ISP.

Default Gateway: Enter the Default Gateway supplied by your ISP.

The screenshot shows the WAN Settings configuration page. At the top, it says "WAN Settings" in orange. Below that, it indicates "WAN connection mode: L2TP". The configuration fields are as follows:

L2TP Server IP:	<input type="text" value="0.0.0.0"/>
User Name:	<input type="text" value="tenda"/>
Password:	<input type="password" value="*****"/>
MTU:	<input type="text" value="1400"/>
Address Mode:	<input type="button" value="Static"/> <input checked="" type="button" value="Dynamic"/>
IP Address:	<input type="text" value="0.0.0.0"/>
Subnet Mask:	<input type="text" value="255.255.255.0"/>
Default Gateway:	<input type="text" value="0.0.0.0"/>

At the bottom of the form, there are two buttons: "Apply" and "Cancel".

PPTP

PPTP Server IP: Enter the Server IP provided by your ISP.

User Name: Enter PPTP username provided by your ISP.

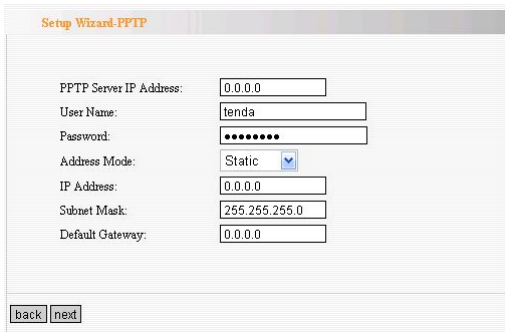

Password: Enter PPTP password provided by your ISP.

Address Mode: Select "Static" if your ISP supplies you with the IP address, subnet mask, and gateway. In most cases, select Dynamic.

IP Address: Enter the PPTP IP address supplied by your ISP.

Subnet Mask: Enter the Subnet Mask supplied by your ISP.

Default Gateway: Enter the Default Gateway supplied by your ISP.

The screenshot shows a web-based configuration page titled "Setup Wizard-PPTP". It contains several input fields for configuring PPTP settings:

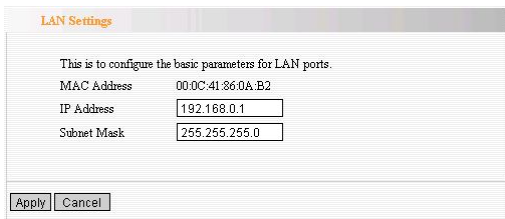

- PPTP Server IP Address: 0.0.0.0
- User Name: tenda
- Password: masked with 10 dots
- Address Mode: Static (selected from a dropdown menu)
- IP Address: 0.0.0.0
- Subnet Mask: 255.255.255.0
- Default Gateway: 0.0.0.0

At the bottom left, there are two buttons labeled "back" and "next".

Chapter 5 Advanced Settings

5.1 LAN Settings

LAN Settings are for the basic TCP/IP parameters of LAN ports.

LAN Settings	
This is to configure the basic parameters for LAN ports.	
MAC Address	00:0C:41:86:0A:E2
IP Address	192.168.0.1
Subnet Mask	255.255.255.0
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

- **MAC Address:** The Router's physical MAC address as seen on your local network, which is unchangeable.
- **IP Address:** The Router's LAN IP addresses (not your PC's IP address). 192.168.0.1 is the default value.
- **Subnet Mask:** It's shown the Router's subnet mask for measurement of the network size. 255.255.255.0 is the default value.

IMPORTANT:

Once you modify the IP address, you need to remember it for the Web-based Utility login next time.

5.2 WAN Settings

After you have selected the ISP connection type in “Setup Wizard” and you want to modify the related settings, here you can modify and configure the settings in details.

Virtual Dial-up (PPPoE)

WAN Settings

WAN connection mode: PPPoE

Account

Password

MTU (Default by 1492. Do NOT Modify Unless Necessary)

Service Name (Do NOT Modify Unless Necessary)

AC Name (Do NOT Modify Unless Necessary)

Internet Connection Option

Connect Automatically.

Connect Manually.

Connect on Demand

Max Idle Time: (60—3600 seconds)

Connect on Fixed Time

IMPORTANT: Please set the time in “System Tools” before you select this Internet connection.

Time: From h m T h m

- **Connection Mode:** Show your current connection mode.
- **Account:** Enter them provided by your ISP.
- **Password:** Enter them provided by your ISP.
- **MTU:** Maximum Transmission Unit. It is the size of largest datagram that can be sent over a network.

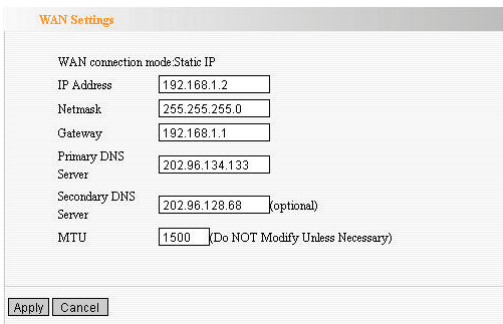

The default value is 1492. Do NOT modify it unless necessary. But if when some specific website or web application software can not be open or enabled, have a try to change the MTU value as 1450, 1400, etc.

- **Service Name:** It is defined as a set of characteristics that are applied to a PPPoE connection. Enter it if provided. Do NOT modify it unless necessary.
- **AC Name:** Enter it if provided. Do NOT modify it unless necessary.
- **Connect Automatically:** Connect automatically to the Internet after rebooting the system or connection failure.
- **Connect Manually:** Connect to the Internet by users manually.
- **Connect on Demand:** Re-establish your connection to the Internet after the specific time (Max Idle Time). Zero means your Internet connection at all time. Otherwise, enter the minutes to be elapsed before you want to disconnect the Internet access.
- **Connect on Fixed Time:** Connect to the Internet during the time you fix.

Notice:

The "Connect on Fixed Time" can be deployed only when you have set the current time in "Time Settings" from "System Tools".

Static IP

The screenshot shows the WAN Settings interface with the following fields and values:

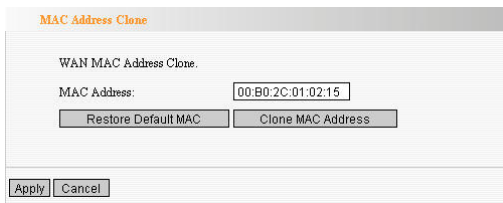

WAN Settings	
WAN connection mode: Static IP	
IP Address	192.168.1.2
Netmask	255.255.255.0
Gateway	192.168.1.1
Primary DNS Server	202.96.134.133
Secondary DNS Server	202.96.128.68 (optional)
MTU	1500 (Do NOT Modify Unless Necessary)
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

If your connection mode, static IP is chosen, you can modify the following addressing information.

- **IP Address:** Here enter the WAN IP address provided by your ISP.
- **Subnet Mask:** Enter the WAN Subnet Mask here.
- **Gateway:** Enter the WAN Gateway here.
- **Primary DNS Server:** Enter the Primary DNS server provided by your ISP.
- **Secondary DNS Server:** Enter the secondary DNS.

5.3 MAC Address Clone

This page is for the Router's MAC address to WAN.

MAC Address Clone

WAN MAC Address Clone.

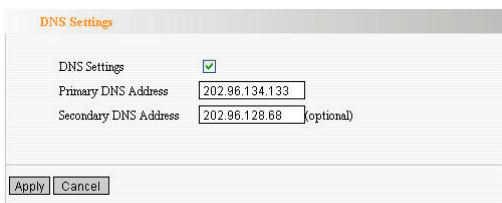

MAC Address:

Some ISPs require end-user's MAC address to access their network. This feature copies the MAC address of your network device to the Router.

- **MAC Address:** The MAC address to be registered with your Internet service provider.
- **Clone MAC Address:** Register your PC's MAC address.
- **Restore Default MAC Address:** Restore to the default hardware MAC address.

5.4 DNS Settings

DNS is short for Domain Name System (or Service), an Internet service that translate domain names into IP addresses which are provided by your Internet Service Provider. Please consult your Internet Service Provider for details if you do not have them.

DNS Settings	
DNS Settings	<input checked="" type="checkbox"/>
Primary DNS Address	<input type="text" value="202.96.134.133"/>
Secondary DNS Address	<input type="text" value="202.96.128.68"/> (optional)
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

- **DNS:** Click the checkbox to enable the DNS server. The Router's DHCP sever will answer the client's requests and distribute DNS address.
- **Primary DNS Address:** Enter the necessary address provided by your ISP.
- **Secondary DNS Address:** Enter the second address if your ISP provides, which is optional.

Notice:

After the settings are completed, reboot the device to activate the modified settings.

5.5 WAN Media Type

In most cases, ISP provides wired WAN access (ADSL MODEM, Cable MODEM, etc.) and you only need to insert the line into the Router's WAN port. Sometime, wireless WAN access type, more flexible and convenient, is also provided by some ISP.

WAN Medium

WAN Medium: Wired WAN Wireless WAN

SSID: wireless

MAC: 00:0A:0B:11:22:33

Channel: 1

Security Mode: WPA2-PSK

WPA/WPA2 Algorithms: TKIP AES

Pass Phrase: 12345678

Open Scan

Apply Cancel

- **Wired WAN:** In this type, WAN port should be connected by wired cable. This type is the device's default option.
- **Wireless WAN:** When your ISP provides wireless access service, you can enable this WAN access type.
- **SSID:** SSID (Service Set Identifier) is the ID name of the wireless device. You must input the correct SSID and keep it the same SSID with your ISP's wireless device. Otherwise, it is not allowed to have

access to your ISP network. Click "Open Scanner" to search the available SSID.

- **MAC:** Enter the MAC address of ISP wireless device. Click "Open Scanner" to search the MAC address.
- **Channel:** Wireless device's communication channel. Keep it the same channel with your ISP's wireless device. Click "Open Scanner" to search the available AP channel.
- **Security Mode:** If your ISP has set the security parameters, the receiving station must set the same security mode, encryption method and key with ISP's device.

If you know the ISP wireless device's SSID, enter the SSID, Wireless MAC address, Channel and Encryption method into the corresponding fields. Certainly you can click the "Open Scanner" button to fill these fields automatically. After you apply the settings, In "Setup Wizard" page select the corresponding WAN connection type to connect the Internet. For example: If your ISP wireless device provides Dynamic IP access type, you need to select "Dynamic IP (Via DHCP)".

Chapter 6 Wireless Setting

6.1 Basic Settings

Basic Settings

Enable Wireless

Network Mode: 11b/g/n mixed mode

Main SSID: Tenda

Minor SSID:

Broadcast(SSID): Enable Disable

MBSSID AP Isolation: Enable Disable

AP Isolation: Enable Disable

BSSID: 00:B0:2C:01:02:10

Channel: AutoSelect

Operating Mode: Mixed Mode Green Field

Channel BandWidth: 20 20/40

Guard Interval: long Auto

MCS: Auto

Reverse Direction Grant(RDG): Disable Enable

Extension Channel: Auto Select

Aggregation MSDU (A-MSDU): Disable Enable

Apply Cancel

- **Enable Wireless:** Check to enable the Router's wireless features; uncheck to disable it.
- **Network Mode :** Select one mode from the following. The default is 11b/g/n mode.

- 11b mode:** Allow the wireless client to connect with the device in 11b mode at the maximum speed of 11Mbps.
- 11g mode:** Allow the 11g/11n-compliant client device to connect with the AP at the maximum speed of 54Mbps.
- 11b/g mode:** Allow the 11b/g-compliant client device to connect with the AP with auto-negotiation speed, and 11n wireless client to connect the device with 11g speed.
- 11b/g/n mode:** Allow 11b/g/n-compliant client device to connect with the AP with auto-negotiation speed.
- **Main SSID:** SSID (Service Set Identifier) is the unique name of the wireless network. This device has two SSID and the main SSID is necessary.
 - **Minor SSID:** It is optional.
 - **Broadcast (SSID):** Select "Enable" to enable the device's SSID to be visible by wireless clients. The default is enabled.
 - **MBSSID AP Isolation :** One access control feature based on wireless MAC address. When this feature is enabled, wireless clients connected with the same SSID can not communicate with each other. For example, configure main SSID as AP1, minor SSID as AP2. PC1 and PC2 connect to AP1

via wireless adapter, and configure PC1 and PC2 in the same segment. After the feature is enabled, two PCs can not communicate and share network resource each other, but they can communicate with wireless clients connected with AP2. This feature is to isolate the communication of wireless clients connected with the same SSID.

- **AP Isolation:** One access control feature based on SSID. When this feature is enabled, each of your wireless clients will be in its own virtual network and will not be able to communicate with each other. When this feature is enabled, wireless clients connected with the Main SSID and Minor SSID can not communicate with each other, which can secure the wireless network strongly. For example, configure main SSID as AP1, minor SSID as AP2. PC1 connects to AP1 via wireless adapter; PC2 connecting to AP2. After the feature is enabled, two PCs can not communicate and share network resource each other. This feature is to isolate the communication of wireless clients connected with different SSID.
- **Tip:** If you want to isolate all connected wireless client's communication, please enable MBSSID AP Isolation and AP Isolation simultaneously.
- **BSSID:** Basic Service Set Identifier of wireless network. In IEEE802.11, BSSID is the MAC address of wireless access point.

- **Channel:** Specify the effective channel (from 1 to 13\Auto) of the wireless network.
- **Extension Channel:** To increase data throughput of wireless network, the extension channel range is used in 11n mode.
- **Channel Bandwidth :** Select the channel bandwidth to improve the wireless performance. When the network has 11b/g and 11n clients, you can select the 40M; when it is an 11n network, select 20/40M to improve its throughput.

6.2 Wireless Security Setting

It is used to configure the AP network's security setting. Here presents the common six (ten in all) encryption methods, including Mixed WEP, WPA-personal, WPA-enterprise, WPA2-personal, WPA2- enterprise, etc.

6.2.1 Mixed WEP

WEP (Wired Equivalent Privacy), a basic encryption method, usually encrypts wireless data using a series of digital keys (64 bits or 128 bits in length). By using the same keys on each of your wireless network devices, you can prevent unauthorized wireless devices from monitoring your transmissions or using your wireless

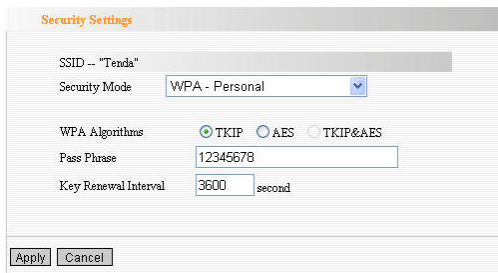

resources. Select Mixed WEP to enter the following window:

The screenshot shows the 'Security Settings' window. The SSID is 'Tenda'. The Security Mode is 'Mixed WEP'. The Default Key is 'Key 1'. The WEP Key 1 field contains '1111111111'. The WEP Key 2, WEP Key 3, and WEP Key 4 fields are empty. Each key field has a 'Hex' dropdown menu. At the bottom are 'Apply' and 'Cancel' buttons.

- **Select SSID:** Select the SSID (main SSID or minor SSID) to configure security setting from the drop-down menu.
- **Security Mode:** From the drop-down menu select the corresponding security encryption modes.
- **WEP Key1~4:** Set the WEP key with the format of ASCII and Hex. You can enter ASCII code (5 or 13 ASCII characters. Illegal character as "/" is not allowed.) Or 10/26 hex characters.
- **Default Key:** Select one key from the four configured keys as the current available one.

6.2.2 WPA-Personal

WPA (Wi-Fi Protected Access), a Wi-Fi standard, is a more recent wireless encryption scheme, designed to improve the security features of WEP. It applies more powerful encryption types (such as TKIP [Temporal Key Integrity Protocol] or AES [Advanced Encryption Standard]) and can change the keys dynamically on every authorized wireless device.

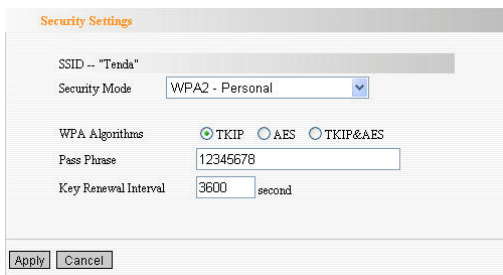

The screenshot displays the 'Security Settings' configuration page. At the top, the title 'Security Settings' is shown in orange. Below it, the SSID is set to 'Tenda'. The Security Mode is set to 'WPA - Personal'. Under WPA Algorithms, the 'TKIP' radio button is selected, while 'AES' and 'TKIP&AES' are unselected. The Pass Phrase field contains '12345678'. The Key Renewal Interval is set to '3600' seconds. At the bottom, there are 'Apply' and 'Cancel' buttons.

- **Select SSID:** Select the SSID (main SSID or minor SSID) to configure security setting from the drop-down menu.
- **WPA Algorithms:** Provides TKIP [Temporal Key Integrity Protocol] or AES [Advanced Encryption Standard]. The default is TKIP mode.
- **Pass Phrase:** Enter the encrypted characters with 8-63 ASCII characters.
- **Key Renewal Interval:** Set the key's renewal period.

6.2.3 WPA2- Personal

WPA2 (Wi-Fi Protected Access version 2) provides higher security than WEP (Wireless Equivalent Privacy) and WPA (Wi-Fi Protected Access).

The screenshot shows the 'Security Settings' interface. At the top, the SSID is 'Tenda'. Below it, the Security Mode is a dropdown menu set to 'WPA2 - Personal'. Under 'WPA Algorithms', there are three radio buttons: 'TKIP' (selected), 'AES', and 'TKIP&AES'. The 'Pass Phrase' field contains '12345678'. The 'Key Renewal Interval' is set to '3600' seconds. At the bottom, there are 'Apply' and 'Cancel' buttons.

- **Select SSID:** Select the SSID (main SSID or minor SSID) to configure security setting from the drop-down menu.
- **WPA Algorithms:** Provides TKIP [Temporal Key Integrity Protocol] or AES [Advanced Encryption Standard]. The default is TKIP mode.
- **Pass Phrase:** Enter the encrypted characters with 8-63 ASCII characters.
- **Key renewal Interval:** Set the key's renewal period.

6.2.4 WPA- Enterprise

This security mode is used when a RADIUS server is connected to the device. Select "WPA-Enterprise" from the drop-down menu to enter the following window:

The screenshot shows the "Security Settings" window for a Tenda router. The "SSID Choice" is set to "Tenda". The "Security Mode" is set to "WPA - Enterprise". Under "WPA Algorithms", "TKIP" is selected. The "Key Renewal Interval" is set to 3600 seconds. The "Radius IP Address" is 192.168.0.100, "Radius Port" is 1812, "Shared Key" is 66666666, and "Session Timeout" is 3600. There are "Apply" and "Cancel" buttons at the bottom.

SSID Choice	Tenda
Security Mode -- "Tenda"	
Security Mode	WPA - Enterprise
WPA Algorithms	<input checked="" type="radio"/> TKIP <input type="radio"/> AES <input type="radio"/> TKIP&AES
Key Renewal Interval	3600 second
Radius IP Address	192.168.0.100
Radius Port	1812
Shared Key	66666666
Session Timeout	3600

Apply Cancel

- **Select SSID:** Select the SSID (main SSID or minor SSID) to configure security setting from the drop-down menu.
- **WPA Algorithms:** Provides TKIP [Temporal Key Integrity Protocol] or AES [Advanced Encryption Standard]. The default is TKIP mode.
- **Key Renewal Interval:** Set the key's renewal period.
- **Radius Server:** Enter the IP address of the Radius server.
- **Radius Server port:** Enter the authentication

- port of the Radius server. The default is 1812.
- **Shared Secret** : Enter the shared key for authentication server with 8~63 ASCII characters.
 - **Session Timeout** : The authentication interval period between AP and authentication server.

6.2.5 WPA2-Enterprise

This security mode is based on Radius authentication server and WPA2 encryption method. WPA2 is used when a RADIUS server is connected to the device. Select "WPA2-Enterprise" from the drop-down menu to enter the following window:

The screenshot shows the "Security Settings" window for a Tenda router. The "SSID Choice" is set to "Tenda". The "Security Mode" is set to "WPA2 - Enterprise". Under "WPA Algorithms", "TKIP" is selected. The "Key Renewal Interval" is set to 3600 seconds, and the "PMK Cache Period" is set to 10 minutes. "Pre-Authentication" is set to "Disable". The "Radius IP Address" is 192.168.0.100, the "Radius Port" is 1812, the "Shared Key" is 66666666, and the "Session Timeout" is 3600. "Apply" and "Cancel" buttons are at the bottom.

Security Settings	
SSID Choice	Tenda
Security Mode -- "Tenda"	
Security Mode	WPA2 - Enterprise
WPA Algorithms	<input checked="" type="radio"/> TKIP <input type="radio"/> AES <input type="radio"/> TKIP&AES
Key Renewal Interval	3600 second
PMK Cache Period	10 minute
Pre-Authentication	<input checked="" type="radio"/> Disable <input type="radio"/> Enable
Radius IP Address	192.168.0.100
Radius Port	1812
Shared Key	66666666
Session Timeout	3600
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

- **Select SSID :** Select the SSID (main SSID or minor SSID) to configure security setting from the drop-down menu.
- **WPA Algorithms:** Provides TKIP [Temporal Key Integrity Protocol] or AES [Advanced Encryption Standard]. The default is TKIP mode.
- **Key Renewal Interval:** Set the key's renewal period.
- **Radius Server:** Enter the IP address of the Radius server.
- **Radius Server port:** Enter the authentication port of the Radius server. The default is 1812.
- **Shared Secret :** Enter the shared key for authentication server with 8~63 ASCII characters.
- **Session Timeout:** The authentication interval period between AP and authentication server. The default is 3600s.

6.2.6 802.1X

This security mode is used when a RADIUS server is connected to the device. 802.1x, a kind of Port-based authentication protocol, is an authentication type and strategy for users. The port can be either a physic port or logic port (such as VLAN). For wireless LAN users, a port is just a channel. The final purpose of 802.11x authentication is to check if the port can be used. If the port is authenticated successfully, you can open this

port which allows all the messages to pass. If the port isn't authenticated successfully, you can keep this port "disable" which just allows 802.1x authentication protocol message to pass. Select "802.1x" from the drop-down menu to enter the following window:

Security Settings

SSID Choice: Tenda

Security Mode -- "Tenda"

Security Mode: 802.1X

WEP: Disable Enable

Radius IP Address: 192.168.0.100

Radius Port: 1812

Shared Key: 66666666

Session Timeout: 3600

Apply Cancel

- **Select SSID:** Select the SSID (main SSID or minor SSID) to configure security setting from the drop-down menu.
- **WEP:** Click "Enable/Disable" to enable or disable the WEP algorithm.
- **Radius Server:** Enter the IP address of the Radius server.
- **Radius Server Port:** Enter the authentication port of the Radius server. The default is 1812.
- **Shared Secret :** Enter the shared key for authentication server with 8~63 ASCII characters.

- **Session Timeout :** The authentication interval period between AP and authentication server. The default is 3600s.

Note:

To improve security level, do not use too easy characters. If you are not familiar with these ten security modes, it is recommended to use “WPA-Personal” mode.

6.3 Advanced Settings

This section is to configure the advanced wireless setting of the Router, including the Radio Preamble, 802.11g/n Rate, Fragmentation Threshold, RTS Threshold, etc.

Advanced Settings

BG Protection Mode	Auto
Basic Data Rates	Default(1-2-5.5-11 Mbps)
Beacon Interval	100 ms (range 20 - 999, default 100)
Fragment Threshold	2346 (range 256 - 2346, default 2346)
RTS Threshold	2347 (range 1 - 2347, default 2347)
TX Power	100 (range 1 - 100, default 100)

WMM Capable Enable Disable

APSD Capable Enable Disable

- **BG protection Mode:** Auto by default. It is for 11b/g wireless client to connect 11n wireless network smoothly in a complicated wireless area.
- **Basic Data Rates:** For different requirement, you can select one of the suitable Basic Data Rates. Here, default value is (1-2-5.5-11Mbps...). It is recommended not to modify this value.
- **Beacon Interval:** Set the beacon interval of wireless radio. Default value is 100. It is recommended not to modify this value.
- **Fragment Threshold:** The fragmentation threshold defines the maximum transmission packet size in bytes. The packet will be fragmented if the arrival is bigger than the threshold setting. The default size is 2346 bytes. It is recommended not to modify this value.
- **RTS Threshold:** RTS stands for "Request to Send". This parameter controls what size data packet the frequency protocol issues to RTS packet. The default value of the attribute is 2346. It is recommended not to modify this value in SOHO environment.
- **TX Power:** Set the output power of wireless radio. The default value is 100.
- **WMM Capable:** It will enhance the data transfer performance of multimedia data when they're being transferred over wireless network. It is recommended to enable this option.

- **APSD Capable:** It is used for auto power-saved service. The default is disabled.

6.4 WPS Settings

WPS (Wi-Fi Protected Setting) can be easy and quick to establish the connection between the wireless network clients and the device through encrypted contents. The users only enter PIN code or press WPS button on the panel to configure it without selecting encryption method and secret keys by manual. In the “Wireless settings” menu, click “WPS settings” to enter the next screen.

WPS Config

You could setup security easily by choosing PIN or PBC method to do Wi-Fi Protected Setup.

WPS Settings: Disable Enable

WPS mode: PBC PIN

WPS Summary

WPS Current Status:	Idle
WPS Configured:	No
WPS SSID:	Tenda
WPS Auth Mode:	Open
WPS Encryp Type:	None
WPS Default Key Index:	1
WPS Key(ASCII):	
AP PIN:	00660648

Save Reset OOB

- **WPS settings:** To enable or disable WPS function. The default is “disable”.

- **WPS mode:** Provide two ways: PBC (Push-Button Configuration) and PIN code.
- **PBC:** Select the PBC or press the WPS button on the front panel of the device for about one second (Press the button for about one second and WPS indicator will be blinking for 2 minutes, which means the WPS is enabled. During the blinking time, you can enable another device to implement the WPS/PBC negotiation between them. Two minutes later, the WPS indicator will be off, which means the WPS connection is completed. If more clients are added, repeat the above steps. At present, the WPS supports up to 32 clients access.)
- **PIN:** If this option is enabled, you need to enter a wireless client's PIN code in the field and keep the same code in the WPS client.
- **WPS Summary:** Show the current state of Wi-Fi protected setting, including authorized mode, encryption type, default key and other information.
- **WPS Current Status:** Idle means WPS in idle state. Start MSC process means the process has been started and waits for being connected. Configured means the negotiation is successful between server and clients.
- **WPS Configured:** "yes" means WPS feature is enabled and goes into effect. "not used" means it is not used. Usually the AP-security has been enabled, here will displayed "not used".
- **WPS SSID:** Show the main SSID set by WPS.

- **WPS Auth. Mode :** The authorization mode deployed by WPS, generally WPA/WPA2-personal mode.
- **WPS Encrypt Type:** The encryption type used by WPS, generally AES/TKIP.
- **WPS key :** The effective key generated by AP automatically.
- **AP PIN (KEY) :** The PIN code used by default.
- **Reset OOB:** When this button is pressed, the WPS client will be idle state, and WPS indicator will be turned off. AP will not respond the WPS client's requests and the set the security mode as WPA mode.

6.5 WDS Settings

WDS (Wireless Distribution System) is used to expand wireless coverage area. This Router provides three modes: Lazy, Bridge and Repeater.

WDS Settings

WDS Mode: Disable

- Disable
- Lazy Mode
- Bridge Mode
- Repeater Mode

Attention: To configure the WDS function, please enter the MAC address of the connected device's MAC address. If the connected device has configured the WDS encryption method, please enter the same key values.

2. If you need to authorize wireless client's access, please configure the settings in the "Wireless Settings->Security Setting" window. After the configuration is completed, click "Save" and reboot the Router to implement communication between the WDS device.

Lazy: In this mode, the connected device can be Bridge mode or Repeater mode and enter the Router's BSSID to establish the connection.

Bridge: You can wirelessly connect two or more wired networks via this mode. In this mode, you need to add the Wireless MAC address of the connecting device into the Router's AP MAC address table or select one from the scanning table.

Repeater Mode: In this mode, add the opposing MAC address into each own AP MAC address table by manual or scanner to enlarge and extend the wireless radio.

Encrypt Type: Select one from WEP, TKIP, AES for security here.

Pass phrase: Enter the encrypted key for wireless devices.

AP MAC: Input the MAC address of another (opposing) wireless router you want to connect.

 **NOTE:**

It is recommended that two wireless routers keep the same bandwidth, channel number, and security settings. Apply the settings and reboot the Router to activate it.

6.6 Wireless Access Control

To secure your wireless LAN, the wireless access control is actually based on the MAC address management to allow or block the specific clients to access the wireless network. Select “Wireless Setting->Access Control” to display the following screen:

Wireless Access Control

MAC Address Filter:

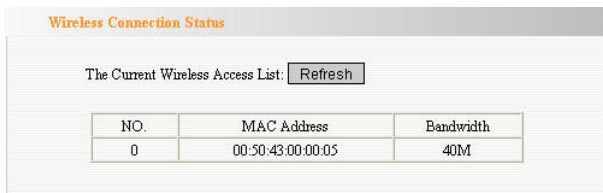

MAC Address Management

MAC Address	Action
00 11 22 33 44 55	<input type="button" value="Add"/>
00:11:22:33:44:55	<input type="button" value="Delete"/>

- **MAC Address Filter:** Enable/disable MAC address filter. Select “Close” to malfunction MAC address; “disable” to prevent the MAC addresses in the list from accessing the wireless network; “Allow” to allow the MAC address in the list to access the wireless network.
- **MAC Address Management:** Input the MAC address to implement the filter policy. Click “Add” to finish the MAC add operation.
- **MAC list:** Show the added MAC addresses. You can add or delete them.

6.7 Connection Status

This page shows wireless client's connection status, including MAC address, Channel bandwidth, etc. Select "Wireless Setting->connection status" to enter the following screen:

Wireless Connection Status

The Current Wireless Access List:

NO.	MAC Address	Bandwidth
0	00:50:43:00:00:05	40M

- **MAC Address:** Shows current MAC addresses of the hosts connecting to the Router.
- **Bandwidth :** Shows current bandwidth of the hosts (wireless client).

Chapter 7 DHCP Server

7.1 DHCP Settings

DHCP (Dynamic Host Control Protocol) is to assign an IP address to the computers on the LAN/private network. When you enable the DHCP Server, the DHCP Server will allocate automatically an unused IP address from the IP address pool to the requesting computer in premise of activating "Obtain an IP Address Automatically". So specifying the starting and ending address of the IP Address pool is needed.

DHCP Server	
DHCP Server	<input checked="" type="checkbox"/> Enable
IP Address Start	192.168.150. <input type="text" value="100"/>
IP Address End	192.168.150. <input type="text" value="200"/>
Lease Time	<input type="text" value="One day"/> ▼
<input type="button" value="Apply"/> <input type="button" value="Cancel"/>	

- **DHCP Server:** Activate the checkbox to enable DHCP server.
- **IP Address Start/End:** Enter the range of IP address for DHCP server distribution.
- **Lease Time:** The length of the IP address lease.

For example:

If the lease time is an hour, then DHCP server will reclaim the IP address in each hour.

7.2 DHCP List and Binding

The Static IP assignment is to add a specifically static IP address to the assigned MAC address. You can view the related information in the DHCP server list.

Static IP

IP Address 192.168.150.11

MAC Address 22 22 22 22 22 22

NO.	IP Address	MAC Address	IP-MAC bind	Delete
1	192.168.150.11	22:22:22:22:22:22	<input checked="" type="checkbox"/>	<input type="button" value="Delete"/>

Host Name	IP Address	MAC Address	Lease
8322a570b33e423	192.168.150.100	00:50:43:00:00:05	23:24:52
Office	192.168.150.101	00:13:02:11:65:B3	00:00:00
Office	192.168.150.102	00:19:21:9E:35:20	00:00:00

- **IP Address:** Enter the IP address which needs to be bound.
- **MAC Address:** Enter the MAC address of the computer you want to assign the above IP address. Click "Add" to add the entry in the list.
- **Hostname:** The name of the computer which is added a new IP address.
- **Lease Time:** The left time length of the corresponding IP address lease.

Chapter 8 Virtual Server

8.1 Single Port Forwarding

The Router can be configured as a virtual server on behalf of local services behind the LAN port. The given remote requests will be re-directed to the local servers via the virtual server. This section deals with the single port forwarding mainly. The Single Port Forwarding allows you to set up kinds of public services such as web servers, ftp, e-mail and other specialized Internet applications on your network.

Single Port Forwarding

The Router can be configured as a virtual server on behalf of local services behind the LAN port. The given remote requests will be re-directed to the local servers via the virtual server. This section deals with the single port forwarding mainly. The Single Port Forwarding allows you to set up kinds of public services such as web servers, ftp, e-mail and other specialized Internet applications on your network.

Note: the virtual server uses known host-name or public IP address.

NO.	External-Internal Port	To IP Address	Protocol	Enable	Delete
1.	40 80	192.168.1.50 100	TCP	<input checked="" type="checkbox"/>	<input type="checkbox"/>
2.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
3.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
4.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
5.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
6.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
7.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
8.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
9.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>
10.		192.168.1.50	TCP	<input type="checkbox"/>	<input type="checkbox"/>

Well-Known Service Port: DNS(53) Add ID 1

Apply Cancel

- **External Port:** This is the external (WAN) port number for server or Internet application, for

example, port 21 for ftp service.

- **Internal Port:** This is the port number of LAN computer set by the Router. The Internet traffic from the external port will forward to the internal port. For example: you can set the internal port NO.66 to act as the external port NO.21 for ftp service.
- **IP Address:** Enter the IP address of the PC where you want to set the applications.
- **Protocol:** Select the protocol (TCP/UDP/Both) for the application.
- **Delete/Enable:** Click to check it for corresponding operation.
- **Well-Known Service Port:** Select the well-known services as DNS, FTP from the drop-down menu to add to the configured one above.

 **NOTE:**

If you set the virtual server of the service port as 80, you must set the Web management port on Remote Web Management page to be any value except 80 such as 8080. Otherwise, there will be a conflict to disable the virtual server.

8.2 Port Range Forwarding

This section deals with the port range forwarding mainly. The Port Range Forwarding allows you to set up a range of public services such as web servers, ftp, e-mail and other specialized Internet applications to an assigned IP address on your LAN.

Port Range Forwarding

The Router can be configured as a virtual server on behalf of local services behind the LAN port. The given remote requests will be re-directed to the local servers via the virtual server. This section deals with the port range forwarding mainly. The Port Range Forwarding allows you to set up kinds of public services such as web servers, ftp, e-mail and other specialized Internet applications on your network.

NO.	Start Port-End Port	To IP Address	Protocol	Enable	Delete
1.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
2.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
3.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
4.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
5.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
6.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
7.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
8.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
9.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>
10.	<input type="text"/> - <input type="text"/>	192.168.150 <input type="text"/>	TCP <input type="button" value="v"/>	<input type="checkbox"/>	<input type="checkbox"/>

Well-Known Service Port: DNS(53) ID 1

- **Start/End Port:** Enter the start/end port number which ranges the External ports used to set the server or Internet applications.
- **IP Address:** Enter the IP address of the PC where you want to set the applications.

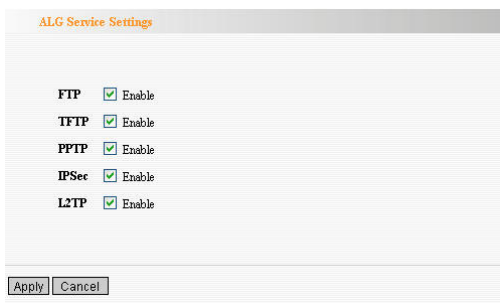

- **Protocol:** Select the protocol (TCP/UDP/Both) for the application.
- **Delete/Enable:** Click to check it for corresponding operation.
- **Well-Known Service Port:** Select the well-known services as DNS, FTP from the drop-down menu to add to the configured one above.
- **Add:** Add the selected well-known port to the policy ID.

 **NOTE:**

If you set the virtual server of the service port as 80, you must set the Web management port on Remote Web Management page to be any value except 80 such as 8080. Otherwise, there will be a conflict to disable the virtual server.

8.3 ALG Service Settings

In the context of computer networking, an ALG or application layer gateway consists of a security component that augments a firewall or NAT employed in a computer network. It allows customized NAT traversal filters to be plugged into the gateway to support address and port translation for certain application layer "control/data" protocols such as FTP, BitTorrent, SIP, RTSP, file transfer applications etc.

In order for these protocols to work through NAT or a firewall, either the application has to know about an address/port number combination that allows incoming packets, or the NAT has to monitor the control traffic and open up port mappings (firewall pinhole) dynamically as required. Legitimate application data can thus be passed through the security checks of the firewall or NAT that would have otherwise restricted the

traffic for not meeting its limited filter criteria.

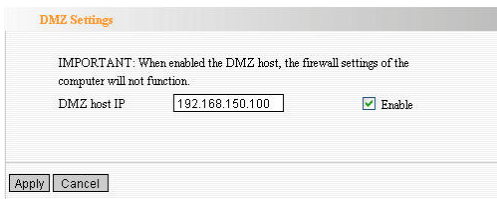

Usually allowing client applications to use dynamic ephemeral TCP/ UDP ports to communicate with the known ports used by the server applications, even though a firewall-configuration may allow only a limited number of known ports. In the absence of an ALG, either the ports would get blocked or the network administrator would need to explicitly open up a large number of ports in the firewall; rendering the network vulnerable to attacks on those ports.

In the default ALG settings, the following protocols have enabled. It is recommended to keep the settings unchanged.

1. FTP
2. TFTP
3. PPTP
4. IPSec
5. L2TP

8.4 DMZ Settings

The DMZ function is to allow one computer in LAN to be exposed to the Internet for a special-purpose service as Internet gaming or videoconferencing.

DMZ Settings

IMPORTANT: When enabled the DMZ host, the firewall settings of the computer will not function.

DMZ host IP Enable

- **DMZ Host IP Address:** The IP address of the computer you want to expose.
- **Enable:** Click the checkbox to enable the DMZ host.
- **IMPORTANT:** When the DMZ host is enabled, the firewall settings of the DMZ host will not function.

8.5 UPnP Settings

It supports latest Universal Plug and Play. This function goes into effect on Windows XP or Windows ME or this function would go into effect if you have installed software that supports UPnP. With the UPnP function, host in LAN can request the router to process some special port switching so as to enable host outside to visit the resources in the internal host.

UPnP Settings

Enable UPnP

- **Enable UPnP:** Click the checkbox to enable the UPnP.

Chapter 9 Traffic Control

9.1 Traffic Control

Traffic control is used to limit communication speed in the LAN and WAN. Up to 20 entries can be supported with the capability for at most 254 PCs' speed control, including for IP address range configuration.

Traffic Control Settings

Traffic Control

Interface **Upload BW** **Download BW**

WAN: (KB/s, The bandwidth can not be zero)

Protocol	Port	Service
Services: <input type="text" value="TCP&UDP"/>	<input type="text" value="0"/>	<input type="text" value="All"/>
IP: <input type="text" value="192.168.0."/>	<input type="text"/>	<input type="text"/>
Up/Down: <input type="text" value="Up"/>		
BW Range: <input type="text"/>	<input type="text"/>	(KB/s, The bandwidth can not be zero)
Apply: <input type="checkbox"/>		

Num	Port	IP	Up/Down	BW Range	Apply	Edit	Del
-----	------	----	---------	----------	-------	------	-----

- **Enable Traffic Control:** To enable or disable the internal IP bandwidth control. The default is disabled.
- **Interface:** To limit the uploading and downloading bandwidth in WAN port.
- **Service:** To select the controlled service type, such

as HTTP service.

- **IP Starting Address:** The first IP address for traffic control.
- **IP Ending Address:** The last IP address for traffic control.
- **Uploading/Downloading:** To specify the traffic heading way for the selected IP addresses: uploading or downloading.
- **Bandwidth:** To specify the uploading/downloading Min. /Max. Traffic speed (KB/s), which can not exceed the WAN speed.
- **Apply:** To enable the current editing rule. If not, the rule will be disabled.
- **Add:** After edit the rule, click the "add to list" button to add the current rule to rule list.
- **Apply:** Click "Save" to activate the current rule.
- **Cancel:** Click "Cancel" to drop all setting saved last time.

9.2 Traffic Statistics

Traffic statistics is used to show the LAN PC's traffic information.

IP Address	UP Rate(KByte/s)	Down Rate(KByte/s)	Send Packet	Send Byte(MByte)	Receive Packet	Receive Byte (MByte)

- **Enable traffic statistics:** check to enable traffic statistics. Usually traffic statistics is disabled, which can improve the Router's data handling. The default is disabled. If it is enabled, the page will update the PC's traffic information automatically and be refreshed every 5 seconds.
- **IP address:** The IP address to be shown.
- **Upstream rate:** the speed of upstream data per second (Kbyte/S).
- **Downstream rate:** the speed of downstream data per second (Kbyte/S).
- **Sending packet:** The PC's packets sending from the PC.
- **Sending byte:** The byte (Mbyte) sending from the PC.
- **Receiving packet:** The PC's packets received from the Router.
- **Receiving byte:** The PC's byte (Mbyte) received from the Router.

Chapter 10 URL Monitor

10.1 URL Monitor

This feature is used to record user's Internet activity, so in terms of this feature, the administrator can check out and control what they can do and have done.

URL Monitor

Enable URL Monitor
 Enable Email

Receive Email Address:
SMTP Server Address:
Send Email Address:
User Name:
Email Password:

Time Triggering Interval: Minute (Range:30-1440Minute)
 Entry Triggering Interval: Entry (Range:100-500)

Time	IP Address	Web Site
------	------------	----------

➤ **Enable URL Monitor:**

After checking this feature, the Router will record LAN computer's URL information, including the visiting Website, your LAN IP address and the time. The Router can record up to 500 entries. If the record is more than 500 entries, the counter will clean all records and restart the URL record again. If the Router is powered off and restarts the device,

the records will be also lost. The default setting is disabled.

- **Enable Email:** To enable this feature, the URL records will be sent to specified e-mail, which can be solved the problem that the records will be lost when it is over 500 entries.
- **Receive E-mail Address:** Input the received E-mail's address here. For example: tenda@sina.com.cn
- **SMTP Server Address:** Input the SMTP server address here. If you are not clear what your SMTP server's address is, you can find them from Help page of the registered e-mail. For example: smtp.sohu.com, smtp.163.com, etc.
- **Send Email Address:** Input the sending email address here.
- **User Name:** Input the sending e-mail's user name.
- **Email Password:** Input the sending e-mail's password.
- **Time Triggering Interval:** To set sending e-mail's time interval. The time ranges from 30 to 1440 minutes. For example: if you input 30 here, it means the Router will send a email from "Send Email Address" to "Receive Email Address" in every 30 minutes. And then the device will clean all records and start the recording again.

- **Entry Triggering Interval:** To set sending e-mail's entry interval. The entry ranges from 100 to 500. For example: if you input 100 here, it means the Router will send a email from "Send Email Address" to "Receive Email Address" in every 100 entries. And then the device will clean all records and start the recording again.

Chapter 11 Security Settings

11.1 Client Filter Settings

To benefit your further management to the computers in the LAN, you can control some ports access to Internet by data packet filter function.

The screenshot shows the 'Client Filter' configuration page. At the top, 'Client Filtering Settings' is checked. The 'Access Policy' is set to '10'. The 'Enable' checkbox is checked, and there is a 'Delete the Policy' button with a 'Clear' label. The 'Filtering Mode' is set to 'Disable', with a note 'access the Internet'. Below this, there are input fields for 'Policy Name', 'Start IP' (192.168.0), 'End IP' (192.168.0), 'Port', and 'Type' (TCP). At the bottom, there are 'Times' and 'Date' settings. The 'Date' is set to 'Everyday'.

- **Client Filter:** Check to enable client filter.
- **Access Policy:** Select one number from the drop-down menu.
- **Enable:** Check to enable the access policy.
- **Clear the Policy:** Click "Clear" button to clear all settings for the policy.

- **Filter Mode:** Click one radio button to enable or disable to access the Internet.
- **Policy Name:** Enter a name for the access policy selected.
- **IP Start/End:** Enter the starting/ending IP address.
- **Port No.:** Enter the port range based over the protocol for access policy.
- **Protocol:** Select one protocol (TCP/UDP/Both) from the drop-down menu.
- **Times:** Select the time range of client filter.
- **Days:** Select the day(s) to run the access policy.

11.2 URL Filter Settings

In order to control the computer to have access to websites, you can use URL filtering to allow the computer to have access to certain websites at fixed time and forbids it having access to certain websites at fixed time.

URL Filter

URL Filtering Setting: Enable

Access Policy: 10

Enable: Delete the Policy:

Filtering Mode: Disable access the Internet
 Enable

Policy Name:

Start IP: 192.168.150

End IP: 192.168.150

URL:

Times: 0:0 - 0:0

Date: Everyday Sun Mon Tue Wen Thr Fri Sat

- **URL Filter:** Check to enable URL filter.
- **Access Policy:** Select one number from the drop-down menu.
- **Enable:** Check to enable the access policy.
- **Clear the Policy:** Click "Clear" button to clear all settings for the policy.
- **Filter Mode:** Click one radio button to enable or disable to access the Internet.
- **Policy Name:** Enter a name for the access policy selected.
- **Start/End IP:** Enter the starting/ending IP address.
- **URL Strings:** Specify the text strings or keywords needed to be filtered. If any part of the URL contains these strings or words, the web page will not be accessible and displayed.
- **Times:** Select the time range of client filter.
- **Days:** Select the day(s) to run the access policy.

11.3 MAC Address Filter

In order to manage the computers in LAN better, you could control the computer's access to Internet by MAC Address Filter.

The screenshot shows the 'MAC Filter' configuration page. At the top, the title 'MAC Filter' is displayed. Below it, the 'MAC Filtering Settings' section has a checked 'Enable' checkbox. The 'Access Policy' is set to '10' in a dropdown menu. There is an 'Enable' checkbox checked and a 'Delete the Policy' button labeled 'Clear'. The 'Filtering Mode' section has two radio buttons: 'Disable' (selected) and 'Enable'. Below this, the 'Policy Name' is 'A' in a text box. The 'MAC Address' is entered as 'AA', 'BB', '11', '22', '33', '44' in six separate boxes. The 'Times' section shows '8' and '0' in dropdowns, followed by a '-' sign, and '18' and '0' in dropdowns. The 'Date' section has a checked 'Everyday' checkbox and unchecked checkboxes for 'Sun', 'Mon', 'Tue', 'Wen', 'Thr', 'Fri', and 'Sat'. At the bottom, there are 'Apply' and 'Cancel' buttons.

- **MAC Address Filter:** Check to enable MAC address filter.
- **Access Policy:** Select one number from the drop-down menu.
- **Enable:** Check to enable the access policy.
- **Clear the Policy:** Click "Clear" button to clear all settings for the policy.
- **Filter Mode:** Click one radio button to enable or disable to access the Internet.
- **Policy Name:** Enter a name for the access policy selected.

- **MAC Address:** Enter the MAC address you want to run the access policy.
- **Times:** Select the time range of client filter.
- **Days:** Select the day(s) to run the access policy.
- **Apply:** Click to make the settings go into effect.

For example:

if you want to configure the host with MAC address 00:C0:9F: AD:FF:C5 not to access the Internet at 8: 00-18: 00, you need to set it as above.

11.4 Prevent Network Attack

This section is to protect the internal network from exotic attack such as SYN Flooding attack, Smurf attack, LAND attack, etc. Once detecting the unknown attack, the Router will restrict its bandwidth automatically. The attacker's IP address can be found from the "System Log".

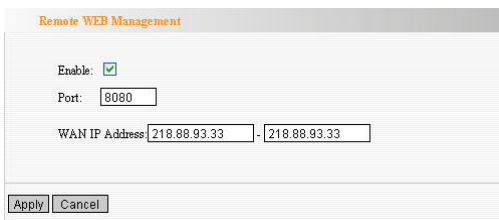

Prevent Network Attack

Apply Cancel

- **Prevent Network Attack:** Check to enable it for attack prevention.

11.5 Remote Web Management

This section is to allow the network administrator to manage the Router remotely. If you want to access the Router from outside the local network, please select the “Enable”.

Remote WEB Management

Enable:

Port:

WAN IP Address

- **Enable:** Check to enable remote web management.
- **Port:** The management port open to outside access. The default value is 80.
- **WAN IP Address:** Specify the range of the WAN IP address for remote management.

Note:

1. If you want to login the device's Web-based interface via port 8080, you need use the format of WAN IP address: port (for example http://219.134.32.101: 8080) to implement remote login.
2. If your WAN IP address starts and ends with

0.0.0.0, it means all hosts in WAN can implement remote Web management. If you change the WAN IP address as 218.88.93.33-218.88.93.35, then only the IP addresses as 218.88.93.33, 218.88.93.34 and 218.88.93.35 can access the Router.

For example: If you want to configure the IP address 218.88.93.33 to access the device's web interface, please set it as follows:

11.6 Local Web Management

Local web management, the alternative to remote web management, is to allow the network administrator to manage the Router in LAN. Any PC in the LAN can access the Web management utility by default. So you can enter the specific MAC address of the LAN computer to function.

Local Web Management

Enable

The MAC Address Format(a.a.c.c.e.f:12:34:11)

MAC1: MAC2:

MAC3: MAC4:

MAC5: MAC6:

Apply Cancel

- **Enable:** Check to enable the local web management.
- **MAC1/2/3...:** Enter the MAC addresses of LAN computers.

Note:

1. In the default state, this feature is not enabled. All computers in the LAN can login the Web.
2. For example, if you only allow the MAC address with 00:11:22:33:E4:F5 to access the Web, please set it as above.

11.7 WAN Ping

The ping test is to check the status of your internet connection. When disabling the test, the system will ignore the ping test from WAN.

- **Ignore Ping from WAN:**
Check to ignore the ping request and give no reply.

Chapter 12 Routing Setting

12.1 Routing Table

The main duty for a router is to look for a best path for every data frame, and transfer this data frame to a destination. So, it's essential for the router to choose the best path, i.e. routing arithmetic. In order to finish this function, many transferring paths, i.e. routing table, are saved in the router, for choosing when needed.

Routing Table

Destination IP	Subnet Mask	Gateway	Metric	Interface
192.168.100.0	255.255.255.0	0.0.0.0	0	eth2.2
192.168.0.0	255.255.255.0	0.0.0.0	0	br0
0.0.0.0	0.0.0.0	192.168.100.100	0	eth2.2

Refresh

12.2 Static Routing

This page is used to configure the Router's static routing.

Static Routing

Destination LAN IP	Subnet Mask	Gateway	Action
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="button" value="Add"/>

- **Destination LAN IP:** The address of the remote host with which you want to construct a static route.
- **Subnet Mask:** The network portion of the Destination LAN IP.
- **Gateway:** The gateway of the next hop, usually the Router or host's IP address.

Note:

1. The gateway must keep the same segment with the Router's LAN IP address.

2. If the destination IP address is one host's IP address, the Subnet mask should be 255.255.255.255.

3. If the destination IP address is an IP address range, the subnet mask should match the IP address. For example, if the IP is 10.0.0.0, subnet mask should be 255.0.0.0; if the IP is 10.1.2.0, subnet mask should be 255.255.255.0.

Chapter 13 System Tools

13.1 Time Settings

This section is to select the time zone for your location. If you turn off the Router, the settings for time disappear. However, the Router will automatically obtain the GMT time again once it has access to the Internet.

Time Settings

Time Zone:
(GMT+08:00)Beijing,China, Hong Kong,Singapore, Taipei

(Notice: GMT time can be obtained only after accessing to the Internet.)

Customized time:

h m s

Apply Cancel

- **Time Zone:** Select your time zone from the drop-down menu.
- **Customized time:** Enter the time you customize.

Note:

When the Router is powered off, the time setting will be lost. Before the Router will obtain GMT time automatically, you need connect with the Internet and obtain the GMT time, or set the time on this page first. Then the time in other features (e.g. firewall) can be activated.

13.2 DDNS

The DDNS (Dynamic Domain Name System) is supported in this Router. It is to assign a fixed host and domain name to a dynamic Internet IP address, which is used to monitor hosting website, FTP server and so on behind the Router. If you want to activate this function, please select “Enable” and a DDNS service provider to sign up.

The screenshot shows the DDNS configuration page. At the top, the title "DDNS" is displayed in orange. Below the title, there are two radio buttons: "Enable" (which is selected) and "Disable". Underneath, there are four input fields: "Service Provider" with a dropdown menu showing "DynDNS.com" and a "Sign up" link; "User Name" with the text "tenda"; "Password" with a masked field of six dots; and "Domain Name" with the text "tenda.syndns.com". At the bottom of the form, there are "Apply" and "Cancel" buttons.

➤ **Main Features:**

Owing to ISP most times provides dynamic IP address, DDNS is used to capture the changeable IP address and match the fixed domain. Then users can have access to the Internet to communicate with others.

DDNS can help you establish virtual host in your home and company.

- **DDNS:** Click the radio button to enable or disable the DDNS service.
- **Service Provider:** Select one from the drop-down

menu and press "Sign up" for registration.

- **User Name:** Enter the user name the same as the registration name.
- **Password:** Enter the password you set.
- **Domain Name:** Enter the domain name which is optional.

For example:

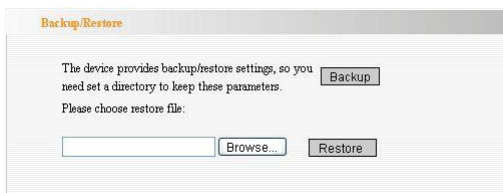

In the local host 192.168.0.10 establish a Web server, and register in 3322.org as follows:

User name	tenda
Password	123456
Domain Name	tenda.vicp.net

After mapping the port in the virtual server, setting account information in DDNS server and in the address field entering <http://tenda.3322.org>, you can access the Web page.

13.3 Backup/Restore Settings

The device provides backup/restore settings, so you need set a directory to keep these parameters.

➤ **Backup Setting:**

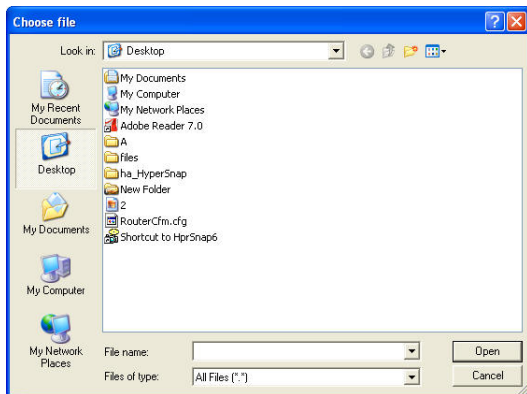

Click "Backup" button to back up the Router's settings and select the path for save.

Click "Save" to save the configuration files.

➤ **Restore Setting:**

Click "Browse" button to select the backup files.

Click "Restore" button to restore previous settings.

13.4 Restore to Factory Default Setting

This button is to reset all settings to the default values. It means the Router will lose all the settings you have set. So please Note down the related settings if necessary.

- **Restore:** Click this button to restore to default settings.

- **Factory Default Settings:**
 - User Name: admin
 - Password: admin
 - IP Address: 192.168.0.1
 - Subnet Mask: 255.255.255.0

 **NOTE:**

After restoring to default settings, please restart the device, then the default settings can go into effect.

13.5 Upgrade Firmware

The Router provides the firmware upgrade by clicking the “Upgrade” after browsing the firmware upgrade packet which you can download from www.tenda.cn.

- **Browse:** click this button to select the upgrade file.
- **Upgrade:** click this button to start the upgrading process. After the upgrade is completed, the Router will reboot automatically.

13.6 Reboot the Router

Rebooting the Router makes the settings configured go into effect or to set the Router again if setting failure happens.

Reboot the router: Click this button to reboot the device.

13.7 Password Change

This section is to set a new user name and password to better secure your router and network.

Change Password

Note: User Name and Password makeup only by number or/and letter.

User Name

Old Password

New Password

Re-enter to Confirm

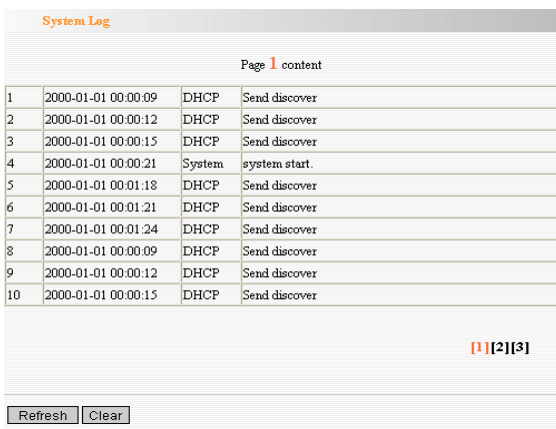

- **User Name:** Enter a new user name for the device.
- **Old Password:** Enter the old password.
- **New Password:** Enter a new password.
- **Re-enter to Confirm:** Re-enter to confirm the new password.

NOTE:

It is highly recommended to change the password to secure your network and the Router.

13.8 System Log

The section is to view the system log. Click the "Refresh" to update the log. Click "Clear" to clear all shown information. If the log is over 150 records, it will clear them automatically.

The screenshot shows a web interface titled "System Log". Below the title, it indicates "Page 1 content". A table displays 10 log entries with columns for ID, Time, Event Type, and Description. At the bottom right, there are page navigation links: [1][2][3]. At the bottom left, there are two buttons: "Refresh" and "Clear".

ID	Time	Event Type	Description
1	2000-01-01 00:00:09	DHCP	Send discover
2	2000-01-01 00:00:12	DHCP	Send discover
3	2000-01-01 00:00:15	DHCP	Send discover
4	2000-01-01 00:00:21	System	system start.
5	2000-01-01 00:01:18	DHCP	Send discover
6	2000-01-01 00:01:21	DHCP	Send discover
7	2000-01-01 00:01:24	DHCP	Send discover
8	2000-01-01 00:00:09	DHCP	Send discover
9	2000-01-01 00:00:12	DHCP	Send discover
10	2000-01-01 00:00:15	DHCP	Send discover

- **Refresh:** Click this button to update the log.
- **Clear:** Click this button to clear the current shown log.

13.9 Logout

After you have finished the settings completely, in logout page click "Yes" to logout the web management page.

Appendix 1: Glossary

Access Point (AP):

Any entity that has station functionality and provides access to the distribution services, via the wireless medium (WM) for associated stations.

Channel:

An instance of medium use for the purpose of passing protocol data units (PDUs) that may be used simultaneously, in the same volume of space, with other instances of medium use (on other channels) by other instances of the same physical layer (PHY), with an acceptably low frame error ratio (FER) due to mutual interference.

SSID:

Service Set identifier. An SSID is the network name shared by all devices in a wireless network. Your network's SSID should be unique to your network and identical for all devices within the network. It is case-sensitive and must not exceed 20 characters (use any of the characters on the keyboard). Make sure this setting is the same for all devices in your wireless network.

WEP:

Wired Equivalent Privacy (WEP) is the method for secure wireless data transmission. WEP adds data encryption to every single packet transmitted in the wireless network. The 40bit and 64bit encryption are the same because of out 64 bits, 40 bits are private. Conversely, 104 and 128 bit are the same. WEP uses a common KEY to encode the data. Therefore, all devices on a wireless network must use the same key and same type of encryption. There are 2 methods for entering the KEY; one is to enter a 16-bit HEX digit. Using this method, users must enter a 10-digit number (for 64-bit) or 26-digit number (for 128-bit) in the KEY field. Users must select the same key number for all devices. The other method is to enter a text and let the computer generate the WEP key for you. However, since each product use different method for key generation, it might not work for different products. Therefore, it is NOT recommended using.

WPA/WPA2:

A security protocol for wireless networks that builds on the basic foundations of WEP. It secures wireless data transmission by using a key similar to WEP, but the added strength of WPA is that the key changes dynamically. The changing key makes it much more

difficult for a hacker to learn the key and gain access to the network. WPA2 is the second generation of WPA security and provides a stronger encryption mechanism through Advanced Encryption Standard (AES), which is a requirement for some government users.

Appendix 2: Ask and Question

In this part some questions and problems shown during the Router's usage and installation will be given suggesting answers. If your problems are not in the list, please log into our website www.tenda.cn or send an E-mail to support@tenda.cn, and we will reply you in the first time.

1、 Can not login to the Web interface of the Router after you enter the IP address in the address field?

Step 1: check the Router if it works well. Once the device is powered on for a few seconds, the SYS indicator on the panel will be turned on. If it is not, please contact us.

Step 2: check the network cables if it is good and the corresponding indicator is "Always ON". Sometimes, the indicator is "Always ON", but it does not mean it gets through.

Run "Ping" command and check if it can ping the Router's LAN IP address 192.168.0.1. If it is OK, please make sure your browser does not access the Internet by proxy server. If the ping fails, you can press the "RESET"

button for 7 seconds to restore to default settings. And then repeat the ping operation. If it still does not work, please contact us.

2、 Forget the login password and can not enter the setting page. What can I do?

Press the "RESET" button for 7 seconds to restore the Router to default settings.

3、 The computer connected with the Router shows IP address conflict. What can I do?

Check if there are other DHCP servers in the LAN. If there have, disable them. The default IP address of the Router is 192.168.0.1 and please maker sure the address is not occupied by other devices. If there are two computers with the same IP addresses, please modify one.

4、 I can not use E-mail and access the Internet. What can I do?

It happens in ADSL connection and Dynamic IP users. And you need modify the default MTU value (1492). Please in the "WAN Setting" modify the MTU value with

the recommended value as 1450 or 1400.

5、 How to configure and access the Internet via Dynamic IP?

In Setup Wizard of the Web utility interface, select "Dynamic IP" connection type and click "Save" to activate it. As some ISPs bind the user computer's MAC address, you need to clone the Router's WAN MAC address to the binding PC's MAC address. Select "MAC Address Clone" in "Advanced Setting" to input your computer's MAC address and click "Apply" to activate it.

6、 How to share my computer's source with other users in Internet?

If you want Internet users to access the internal server via the Router such as e-mail server, Web, FTP, you can configure the "Virtual Server" to come true.

Step 1: create your internal server, make sure the LAN users can access these servers and know related service port. For example, Web server's port is 80; FTP is 21; SMTP is 25 and POP3 is 110.

Step 2: in the Router's web click "Virtual Server" and select "Single Port Forwarding".

Step 3: input the external service port given by the Router, for example, 80.

Step 4: input the internal Web service port, for example, 80.

Step 5: Input the internal server's IP address. If your Web server's IP address is 192.168.0.10, please input it.

Step 6: select the communication protocol used by your internal host: TCP, UDP, ICMP.

Step 7: click "Apply" to activate the settings.

The following table has listed the well-known application and service port:

Server	Protocol	Service Port
WEB Server	TCP	80
FTP Server	TCP	21
Telnet	TCP	23
NetMeeting	TCP	1503、1720
MSN Messenger	TCP/UDP	File Send:6891-6900(TCP) Voice:1863、6901(TCP) Voice:1863、5190(UDP)
PPTP VPN	TCP	1723
Iphone5.0	TCP	22555
SMTP	TCP	25
POP3	TCP	110
